

# SPREADING OUT THE HODGE FILTRATION IN RIGID ANALYTIC GEOMETRY

JORGE ANTÓNIO

ABSTRACT. The goal of the current text is to establish a comparison result between derived de Rham cohomology of (derived)  $k$ -analytic spaces and the cohomology of global sections of formal completions. Our approach is inspired by the deformation to the normal cone provided in [11]. More specifically, given a morphism  $f: X \rightarrow Y$  of (derived)  $k$ -analytic spaces we construct the *non-archimedean deformation to the normal cone* associated to  $f$ . We further show that such deformation can be endowed with a (Hodge) filtration, thus spreading out the usual Hodge filtration on the (completed shifted) analytic tangent bundle to the formal completion. Such filtration agrees with the  $I$ -adic filtration in the case where  $f$  is a closed immersion of (derived)  $k$ -affinoid spaces. Along the way we develop the theory of (ind-inf)- $k$ -analytic spaces or in other words  $k$ -analytic formal moduli problems.

## 1. INTRODUCTION

**1.1. Background.** In [7], B. Bhatt proved the existence of a natural isomorphism between *algebraic derived de Rham cohomology* and Hartshorne's algebraic de Rham cohomology (c.f. [14]), for possibly singular varieties  $X$  over a field  $k$  of characteristic 0. This result can be summarized as follows: given an algebraic variety  $X$  over  $k$ , we can consider the cohomology of the Hodge completed derived de Rham algebra

$$\mathrm{dR}_{X/k} := \mathrm{Sym}(\mathbb{L}_{X/k}[-1])^\wedge \in \mathrm{CAlg}_k,$$

where  $(-)^\wedge$  stands for the completion of the usual symmetric algebra  $\mathrm{Sym}(\mathbb{L}_{X/Y}[-1])$  with respect to its Hodge filtration. We can identify the graded pieces with exterior powers

$$\wedge^i \mathbb{L}_{X/Y}[-i], \quad \text{for } i \geq 0.$$

Therefore, the derived de Rham algebra can be thought as a natural generalization of the usual de Rham complex to the singular case, where we replace the usual sheaf of differentials

$$\Omega_{X/k}^1,$$

by the (algebraic) cotangent complex  $\mathbb{L}_{X/k}$  in the definition. On the other hand, Hartshorne provided, in [14], a construction of algebraic de Rham cohomology in terms of formal completions: assume the existence of a closed immersion  $i: X \hookrightarrow Y$ , where  $Y$  is a smooth algebraic variety over  $k$ . Then one can form the *formal completion*,  $Y_X^\wedge$ , of  $Y$  at  $X$  along the closed immersion  $i$ . Inspired by the theory of tubular neighborhoods, Hartshorne defined an algebraic cohomology theory by taking global sections of  $Y_X^\wedge$

$$\Gamma(Y_X^\wedge, \mathcal{O}_{Y_X^\wedge}).$$

Moreover, the cohomology groups so obtained are independent of the choice of the closed embedding  $i: X \rightarrow Y$ . Bhatt's result amounts to prove a natural multiplicative equivalence of complexes

$$\mathrm{dR}_{X/k} \simeq \Gamma(Y_X^\wedge, \mathcal{O}_{Y_X^\wedge}).$$

Moreover, Bhatt further proved that the Hodge filtration on  $\mathrm{dR}_{X/k}$  induces a (natural) filtration on  $Y_X^\wedge$ , which is finer than the usual Hodge-infinitesimal or Hodge-Deligne filtrations on algebraic de Rham cohomology (see [7]). When  $f: X \rightarrow Y$  is a closed immersion of affine (derived)  $k$ -schemes, the former identifies with the usual  $I$ -adic filtration on the completion  $Y_X^\wedge \simeq \mathrm{Spf}(B_Y^\wedge)$ , where  $B := \Gamma(Y, \mathcal{O}_Y)$ ,  $A := \Gamma(X, \mathcal{O}_X)$  and  $I := \mathrm{fib}(B \rightarrow A)$ .

**1.2. Main results.** The main goal of the present text is to prove a non-archimedean analogue of the above. Namely, let  $k$  be a non-archimedean field of characteristic 0. We prove the following:

**Theorem 1.1.** *Let  $f: X \rightarrow Y$  be a morphism of (geometric) derived  $k$ -analytic stacks. Consider the Hodge completed derived de Rham cohomology of  $f$ , defined as the Hodge completion of the usual symmetric algebra  $\mathrm{dR}_{X/Y}^{\mathrm{an}} := \mathrm{Sym}(\mathbb{L}_{X/Y}^{\mathrm{an}}[-1])^\wedge \in \mathrm{CAlg}_k$ . Then one has a natural multiplicative equivalence*

$$\mathrm{dR}_{X/Y}^{\mathrm{an}} \simeq \Gamma(Y_X^\wedge, \mathcal{O}_{Y_X^\wedge}),$$

*of derived  $k$ -algebras, where  $Y_X^\wedge$  denotes the derived  $k$ -analytic stack corresponding to the formal completion of  $X$  in  $Y$  along the morphism  $f$ .*

Unfortunately, the methods of B. Bhatt are algebraic in nature and cannot be directly extrapolated to the non-archimedean setting. Instead, we follow the approach of Gaitsgory-Rozemblyum (see for instance [11, §9]). The main idea consists of defining the *non-archimedean deformation to the normal cone* as a derived  $k$ -analytic stack

$$\mathcal{D}_{X/Y}^{\mathrm{an}} \in \mathrm{dAnSt}_k,$$

mapping naturally to the  $k$ -analytic affine line  $\mathbf{A}_k^1$ . Denote by  $p: \mathcal{D}_{X/Y}^{\text{an}} \rightarrow \mathbf{A}_k^1$  the natural morphism. Then Theorem 1.1 follows immediately from the following more precise result:

**Theorem 1.2.** *Let  $f: X \rightarrow Y$  be a morphism of geometric  $k$ -analytic stacks. Then the non-archimedean deformation to the normal cone satisfies the following assertions:*

- (1) *The fiber of  $p: \mathcal{D}_{X/Y}^{\text{an}} \rightarrow \mathbf{A}_k^1$  at  $\{0\} \subseteq \mathbf{A}_k^1$  identifies naturally with the completion of the shifted analytic tangent bundle*

$$\mathbf{T}_{X/Y}^{\text{an}}[1]^\wedge,$$

*completed along the zero section  $s_0: X \rightarrow \mathbf{T}_{X/Y}^{\text{an}}[1]$ . Moreover for  $\lambda \neq 0$  we have a natural identification*

$$(\mathcal{D}_{X/Y}^{\text{an}})_\lambda \simeq Y_X^\wedge,$$

*where  $Y_X^\wedge$  denotes the formal completion of  $Y$  at  $X$  along  $f$ .*

- (2) *There exists a natural sequence of square-zero extensions*

$$X \times \mathbf{A}_k^1 = X^{(0)} \rightarrow X^{(1)} \hookrightarrow \dots \hookrightarrow X^{(n)} \hookrightarrow \dots \rightarrow Y \times \mathbf{A}_k^1,$$

*such that the colimit of derived  $k$ -analytic stacks identifies naturally*

$$\text{colim}_{n \geq 0} X^{(n)} \simeq \mathcal{D}_{X/Y}^{\text{an}}.$$

*In particular, the latter induces the usual Hodge filtration on (global sections of)  $\mathbf{T}_{X/Y}^{\text{an}}[1]$  and it induces a further filtration on (global sections of) the formal completion  $Y_X^\wedge$ , which we shall also refer to as the Hodge filtration on the formal completion  $Y_X^\wedge$ ;*

- (3) *When  $f: X \rightarrow Y$  is assumed to be a closed immersion of derived  $k$ -affinoid spaces, the Hodge filtration on  $Y_X^\wedge$  identifies with the  $I$ -adic filtration. More precisely, let  $A := \Gamma(X, \mathcal{O}_X^{\text{alg}})$  and  $B := \Gamma(Y, \mathcal{O}_Y^{\text{alg}})$  denote the corresponding derived global sections derived  $k$ -algebras. Then the induced morphism  $B \rightarrow A$  is a surjection on  $\pi_0$  and the Hodge filtration on  $Y_X^\wedge$  identifies with the  $I$ -adic filtration on the completion  $B_I^\wedge \in \text{CAlg}_k$ , where  $I := \text{fib}(B \rightarrow A)$ .*

In order to construct the deformation to the normal cone  $\mathcal{D}_{X/Y}^{\text{an}}$  we shall need two main ingredients. Namely, a general theory of  $k$ -analytic formal moduli problems for general derived  $k$ -analytic spaces and the relative analytification functor introduced in [15] (see also [23, §6]). So far, a general framework of  $k$ -analytic formal moduli problems was lacking in the literature. For this reason, we devote §3 to develop such framework. Let  $X \in \text{dAn}_k$  be a (derived)  $k$ -analytic space. Denote by  $\text{AnNil}_{X/}^{\text{cl}}$  the  $\infty$ -category of closed embeddings

$$g: X \rightarrow S,$$

where  $S \in \text{dAn}_k$ , such that  $g_{\text{red}}: X_{\text{red}} \rightarrow S_{\text{red}}$  is an isomorphism of  $k$ -analytic spaces. We shall define a  $k$ -analytic formal moduli problem under  $X$  (resp. over  $X$ ) as a functor

$$Y: (\text{AnNil}_{X/}^{\text{cl}})^{\text{op}} \rightarrow \mathcal{S}, \quad (\text{resp. } Y: (\text{AnNil}_X^{\text{cl}})^{\text{op}} \rightarrow \mathcal{S})$$

satisfying some additional requirements, see Definition 2.26 (resp. Definition 2.43). Our main result concerning this theory can be summarized as follows:

**Theorem 1.3.** *Let  $X \in \text{dAn}_k$  denote a derived  $k$ -analytic space. Then the following assertions hold:*

- (1) *The  $\infty$ -category  $\text{AnNil}_{X/Y}^{\text{cl}}$  is filtered and we have a natural equivalence*

$$\text{colim}_{S \in \text{AnNil}_{X/Y}^{\text{cl}}} S \simeq Y;$$

- (2) *The natural morphism  $f: X \rightarrow Y$  admits a relative (pro-)cotangent complex  $\mathbb{L}_{X/Y} \in \text{Pro}(\text{Coh}^+(X))$ , which completely controls the deformation theory of the morphism  $f$ ;*

- (3) *In the case where  $X$  is a derived  $k$ -affinoid space, the  $\infty$ -category of analytic formal moduli problems  $\mathrm{AnFMP}_{X/}$  is presentable and monadic over the usual  $\infty$ -category of ind-coherent sheaves on  $A := \Gamma(X, \mathcal{O}_X^{\mathrm{alg}})$ ,  $\mathrm{IndCoh}(A)$  (see [10]).*

We then define the deformation  $\mathcal{D}_{X/Y}^{\mathrm{an}}$  as a  $k$ -analytic formal moduli problem under  $X$ . We shall further extrapolate the main formal properties of the usual deformation to the normal cone in the algebraic setting proved in [11, §9], via a careful analysis of the behaviour of the relative analytification functor, denoted  $(-)^{\mathrm{an}}$ , and Noetherian approximation.

In particular, when  $f: X \rightarrow Y$  is a morphism of derived  $k$ -affinoid spaces, we have a natural identification

$$\mathcal{D}_{X/Y}^{\mathrm{an}} \simeq (\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}})^{\mathrm{an}},$$

where  $X^{\mathrm{alg}} := \mathrm{Spec} A$  and  $Y^{\mathrm{alg}} := \mathrm{Spec} B$ , with  $A$  and  $B$  are as in Theorem 1.2.

Our approach does not take into consideration the supposedly existence of a *topology* on the derived  $k$ -algebras

$$\mathrm{dR}_{X/Y}^{\mathrm{an}} \quad \text{and} \quad \Gamma(Y_X^{\wedge}, \mathcal{O}_{Y_X^{\wedge}}).$$

We expect nonetheless that the general framework of condensed mathematics can be used effectively in the realm of derived  $k$ -analytic geometry to enhance the algebraic objects considered in the current text with a condensed/topological structure.

**1.3. Relation with other works and future questions.** In [12] the author introduces an algebraic de Rham cohomology theory for rigid  $k$ -analytic spaces. Furthermore, it is proved finiteness of over-convergent de Rham cohomology for a large class of rigid  $k$ -analytic spaces. Let  $X$  be a rigid  $k$ -analytic space, the construction above is related to the study of sections on the formal completion  $Y_X^{\wedge}$  for a closed embedding  $i: X \rightarrow Y$ , where  $Y$  is a smooth rigid  $k$ -analytic space. Therefore, we expect that our derived de Rham cohomology,  $\mathrm{dR}_{X/Y}^{\mathrm{an}}$ , can be compared to the main construction in [12]. In particular, this would provide a proof of finiteness for derived (over-convergent) de Rham cohomology. Moreover, such a comparison result would equip us with a Hodge-to-de Rham spectral sequence for over-convergent de Rham cohomology, in great generality. In order to achieve such a comparison one needs to extend the results in this text to the over-convergent setting. We hope to pursue this venue in a future project.

Ideally, the deformation to the normal bundle would provide an important tool to study the relationship between de Rham cohomology and étale cohomology of  $k$ -analytic spaces, similar to the algebraic case (see [7]). When  $k$  is a field of equi-characteristic zero, we expect that the non-smooth extension of the main construction of [1] in the non-archimedean setting, could be related to the formal completion  $Y_X^{\wedge}$ . More interestingly, would be to study the  $p$ -adic setting. Even though the author currently does not have an idea of how to accomplish this, it might be useful to extrapolate certain results in [8] to the singular case, via derived geometry.

Another future goal closely related to this work is the study of a rigid cohomology theory for singular algebraic varieties and possibly algebraic stacks over perfect fields of positive characteristic. Our hope is that techniques from derived geometry can be useful to reduce questions about the rigid cohomology of singular algebraic varieties to the free case, via simplicial polynomial resolutions of general  $k$ -algebras.

Finally, we expect that the results in this text provide a first step in a consistent study of  $\mathcal{D}_X$ -modules and curved modules outside the smooth case, in the non-archimedean setting. In order to develop such a framework, one has to set the main ingredients of [5] in non-archimedean geometry. One such ingredient is the deformation to the normal cone done in the current text. Another important ingredient is a  $k$ -analytic HKR theorem, which is a work in progress with M. Porta and F. Petit (see the author's thesis [9] for a sketch of proof of the latter statement).

**1.4. Organization of the paper.** In §2, we provide a general review of the main notions of importance for our work. The main notion is that of a nil-isomorphism in the  $k$ -analytic setting. We shall use the general framework of section 2 to develop a theory of  $k$ -analytic formal moduli problems in §3. Our approach follows closely the results in [11]. Section 4 is devoted to a detailed study of the deformation to the normal cone in the non-archimedean setting. We start with a review of the construction in the algebraic case (provided in [11]) and then proceed to establish the construction in the non-archimedean setting in the remaining of section 4.

**1.5. Notations and Conventions.** Let  $k$  be a field of characteristic zero. We let  $\mathrm{dAff}_k$  and  $\mathrm{dAff}_k^{\mathrm{laft}}$  denote the  $\infty$ -categories of affine derived  $k$ -schemes (resp. affine derived  $k$ -schemes almost of finite presentation). We shall denote by  $\mathrm{dSt}_k$  the  $\infty$ -category of derived  $k$ -stacks. We shall further denote by  $\mathrm{dSt}_k^{\mathrm{laft}} \subseteq \mathrm{dSt}_k$  the full subcategory spanned by derived  $k$ -stacks locally almost of finite presentation. Similarly, if we assume that  $k$  is a non-archimedean field of characteristic zero, we shall denote by  $\mathrm{dAnSt}_k$  the  $\infty$ -category of derived  $k$ -analytic stacks introduced in [22]. Given derived  $k$ -stacks  $X, Y \in \mathrm{dSt}_k$  we shall denote by

$$\mathrm{Map}(X, Y) \in \mathrm{dSt}_k,$$

the corresponding mapping stack. If  $X$  and  $Y$  live over  $\mathbb{A}_k^1$ , we then shall denote by

$$\mathrm{Map}_{/\mathbb{A}_k^1}(X, Y) \in (\mathrm{dSt}_k)_{/\mathbb{A}_k^1}.$$

We shall denote by  $\mathrm{dAn}_k$  and  $\mathrm{dAfd}_k$  the  $\infty$ -categories of derived  $k$ -analytic spaces (resp., derived  $k$ -affinoid spaces). We will further denote by  $\mathrm{An}_k$  the usual ordinary category of (discrete)  $k$ -analytic spaces as in [6]. We shall instead use bold letters for the corresponding notions in the non-archimedean setting. Therefore, we shall denote by

$$\mathbf{Map}(X, Y) \in \mathrm{dAnSt}_k,$$

the corresponding  $k$ -analytic mapping stack, whenever  $X, Y \in \mathrm{dAnSt}_k$ . Let  $\mathcal{X}$  be an  $\infty$ -topos. The notion of a *local  $\mathcal{T}_{\mathrm{an}}(k)$ -structure on  $\mathcal{X}$*  was first introduced in [22, Definition 2.4], see also [2, §2].

**1.6. Acknowledgments.** The author would like to express his deep gratitude to Mauro Porta for the encouragement to pursue this project and for many commentaries and suggestions during the realization of the present work. The author would also like to thank to Marco Robalo for a clarifying remark.

## 2. ANALYTIC FORMAL MODULI PROBLEMS

**2.1. Preliminaries.** In the present text, the basic notion consists of the definition of derived  $k$ -affinoid/analytic spaces given in [22, Definition 7.3 and Definition 2.5.], respectively.

**Definition 2.1.** Let  $f: X \rightarrow Y$  be a morphism in the  $\infty$ -category  $\mathrm{dAn}_k$ . We shall say that  $f$  is an *affine morphism* if for every morphism  $Z \rightarrow Y$  in  $\mathrm{dAn}_k$  such that  $Z$  is equivalent to a derived  $k$ -affinoid space, the pullback

$$Z' := Z \times_X Y \in \mathrm{dAn}_k,$$

is a derived  $k$ -affinoid space.

**Definition 2.2.** Let  $f: X \rightarrow Y$  be a morphism in  $\mathrm{dAn}_k$ . We shall say that  $f$  is an *admissible open immersion* if the induced morphism on 0-th truncations

$$t_0(f): t_0(X) \rightarrow t_0(Y),$$

is an admissible open immersion in the sense of [6, §1.3].

**Definition 2.3.** Let  $f: X \rightarrow Y$  be a morphism in  $\mathbf{An}_k$ . We shall say that  $f$  is a *finite morphism* if  $f$  is affine and for every admissible open covering

$$\coprod_{j \in J} V_j \rightarrow Y,$$

the base change morphism

$$U_j := V_j \times_Y Y \rightarrow V_j,$$

exhibits the  $k$ -affinoid algebra  $B_j := \Gamma(U_j, \mathcal{O}_{U_j})$  as a finite  $A = \Gamma(V_j, \mathcal{O}_{V_j})$ -module. Given  $f: X \rightarrow Y$  in the  $\infty$ -category  $\mathbf{dAn}_k$ , we say that  $f$  is *finite* if its truncation  $t_0(f)$  is a finite morphism.

**Definition 2.4.** Let  $X \in \mathbf{An}_k$  denote an (ordinary)  $k$ -analytic space. We denote by  $\mathcal{J}_X \subseteq \mathcal{O}_X$ , the *nil-radical ideal* of  $\mathcal{O}_X$ , that is the sheaf ideal spanned by nilpotent sections on  $X$ . We denote by  $X_{\text{red}}$  the  $k$ -analytic space obtained as the pair  $(X, \mathcal{O}_X/\mathcal{J}_X)$ , which we shall refer to as the *underlying reduced  $k$ -analytic space associated to  $X$* .

*Remark 2.5.* Let  $X \in \mathbf{An}_k$ , then the underlying reduced  $X_{\text{red}} \in \mathbf{An}_k$  is a reduced  $k$ -analytic space, by construction.

**Notation 2.6.** We denote by  $\mathbf{An}_k^{\text{red}} \subseteq \mathbf{An}_k$  the full subcategory spanned by reduced  $k$ -analytic spaces. We further denote by

$$(-)_{\text{red}}: \mathbf{dAn}_k \rightarrow \mathbf{An}_k^{\text{red}},$$

the functor obtained by the association

$$Z \in \mathbf{An}_k \mapsto Z_{\text{red}} \in \mathbf{An}_k^{\text{red}}.$$

We now extend the construction  $(-)_{\text{red}}: \mathbf{An}_k \rightarrow \mathbf{An}_k^{\text{red}}$  to the  $\infty$ -category of derived  $k$ -analytic spaces:

**Definition 2.7.** The *underlying  $k$ -analytic space* functor  $\mathbf{dAn}_k \rightarrow \mathbf{An}_k^{\text{red}}$  is defined as the composite

$$(-)_{\text{red}}: \mathbf{dAn}_k \xrightarrow{t_0(-)} \mathbf{An}_k \xrightarrow{(-)_{\text{red}}} \mathbf{An}_k^{\text{red}}.$$

Given  $X \in \mathbf{dAn}_k$  a derived  $k$ -analytic space we denote by  $X_{\text{red}} \in \mathbf{An}_k^{\text{red}}$  the *underlying reduced  $k$ -analytic space associated with  $X$* .

**Lemma 2.8.** *Let  $f: X \rightarrow Y$  be an admissible open immersion of derived  $k$ -analytic spaces. Then  $f_{\text{red}}: X_{\text{red}} \rightarrow Y_{\text{red}}$  is an admissible open immersion, as well.*

*Proof.* By the definitions, it is clear that the truncation

$$t_0(f): t_0(X) \rightarrow t_0(Y),$$

is an admissible open immersion of ordinary  $k$ -analytic spaces. In the case of ordinary  $k$ -analytic spaces the question is local and we reduce ourselves to the affinoid case. Then it is clear that localization in the ordinary category  $\mathbf{Afd}_k$  commutes with quotients (as the former is defined via a colimit).  $\square$

**Definition 2.9.** In [20, Definition 5.41] the authors introduced the notion of a square-zero extension between derived  $k$ -analytic spaces. In particular, given a morphism  $f: Z \rightarrow Z'$  in  $\mathbf{dAn}_k$ , we shall say that  $f$  *has the structure of a square-zero extension* if  $f$  exhibits  $Z'$  as a square-zero extension of  $Z$ .

*Remark 2.10.* Let  $X \in \mathbf{An}_k$ . Let  $\mathcal{J} \subseteq \mathcal{O}_X$  be an ideal satisfying  $\mathcal{J}^2 = 0$ . Consider the fiber sequence

$$\mathcal{J} \rightarrow \mathcal{O}_X \rightarrow \mathcal{O}_X/\mathcal{J},$$

in the  $\infty$ -category  $\mathrm{Coh}^+(X)$ . We have an induced natural fiber sequence of the form

$$\mathbb{L}_{\mathcal{O}_X}^{\mathrm{an}} \rightarrow \mathbb{L}_{\mathcal{O}_X/\mathcal{J}}^{\mathrm{an}} \rightarrow \mathbb{L}_{(\mathcal{O}_X/\mathcal{J})/\mathcal{O}_X}^{\mathrm{an}},$$

and we have a further identification  $\tau_{\leq 1}(\mathbb{L}_{(\mathcal{O}_X/\mathcal{J})/\mathcal{O}_X}) \simeq \mathcal{J}[1]$ . For this reason, we obtain a well defined morphism

$$d: \mathbb{L}_{\mathcal{O}_X/\mathcal{J}} \rightarrow \mathcal{J}[1],$$

in the derived  $\infty$ -category  $\mathrm{Mod}_{\mathcal{O}_X/\mathcal{J}}$ . This derivation classifies a square-zero extension of  $\mathcal{O}_X/\mathcal{J}$  by  $\mathcal{J}[1]$  which can be identified with the object  $\mathcal{O}_X$  itself. In particular, we deduce that  $X$  is a square-zero extension of the ordinary  $k$ -analytic space  $(X, \mathcal{O}_X/\mathcal{J})$ .

*Remark 2.11.* Recall the  $\infty$ -category  ${}^{\mathrm{R}}\mathrm{Top}(\mathcal{T}_{\mathrm{an}}(k))$  of  $\mathcal{T}_{\mathrm{an}}(k)$ -structured  $\infty$ -topoi defined in [22, Definition 2.4], where  $\mathcal{T}_{\mathrm{an}}(k)$  denotes the  $k$ -analytic pre-geometry (see for instance [22, Construction 2.2]). Let  $\mathcal{O} \in \mathrm{Str}_{\mathcal{T}_{\mathrm{an}}(k)}^{\mathrm{loc}}(\mathcal{X})$  be a local  $\mathcal{T}_{\mathrm{an}}(k)$ -structure on  $\mathcal{X}$  (c.f. [22, Definition 2.4]). Since the pregeometry  $\mathcal{T}_{\mathrm{an}}(k)$  is compatible with  $n$ -truncations, c.f. [22, Theorem 3.23], it follows that  $\pi_0(\mathcal{O}) \in \mathrm{Str}_{\mathcal{T}_{\mathrm{an}}(k)}^{\mathrm{loc}}(\mathcal{X})$ , as well.

Moreover, if  $(\mathcal{X}, \mathcal{O}) \in {}^{\mathrm{R}}\mathrm{Top}(\mathcal{T}_{\mathrm{an}}(k))$  is a  $\mathcal{T}_{\mathrm{an}}(k)$ -structured  $\infty$ -topos, we define its *underlying reduced  $\mathcal{T}_{\mathrm{an}}(k)$ -structured  $\infty$ -topos* as the  $\mathcal{T}_{\mathrm{an}}(k)$ -structured space

$$(\mathcal{X}, \pi_0(\mathcal{O})/\mathcal{J}) \in {}^{\mathrm{R}}\mathrm{Top}(\mathcal{T}_{\mathrm{an}}(k)),$$

where  $\mathcal{J} \subseteq \pi_0(\mathcal{O})$  denotes the ideal sheaf spanned by nilpotent sections on  $\pi_0(\mathcal{O})$ . Moreover, the quotient  $\pi_0(\mathcal{O})/\mathcal{J}$  is considered in the  $\infty$ -category of local structures on  $\mathcal{X}$

$$\pi_0(\mathcal{O})/\mathcal{J} \in \mathrm{Str}_{\mathcal{T}_{\mathrm{an}}(k)}^{\mathrm{loc}}(\mathcal{X}).$$

Recall the notion of the underlying algebra functor  $(-)^{\mathrm{alg}}: \mathrm{Str}_{\mathcal{T}_{\mathrm{an}}(k)}^{\mathrm{loc}}(\mathcal{X}) \rightarrow \mathrm{CAlg}_k(\mathcal{X})$  introduced in [22, Lemma 3.13].

**Lemma 2.12.** *Let  $Z := (\mathcal{Z}, \mathcal{O}_Z) \in {}^{\mathrm{R}}\mathrm{Top}(\mathcal{T}_{\mathrm{an}}(k))$  denote a  $\mathcal{T}_{\mathrm{an}}(k)$ -structure  $\infty$ -topos such that  $\pi_0(\mathcal{O}_Z^{\mathrm{alg}})$  is a Noetherian derived  $k$ -algebra on  $\mathcal{Z}$ . Suppose that the reduction  $Z_{\mathrm{red}}$  is equivalent to a derived  $k$ -affinoid space. Then the truncation  $t_0(Z)$  is isomorphic to an ordinary  $k$ -affinoid space. If we assume further that for every  $i > 0$ , the homotopy sheaves  $\pi_i(\mathcal{O}_Z)$  are coherent  $\pi_0(\mathcal{O}_Z)$ -modules, then  $Z$  itself is equivalent to a derived  $k$ -affinoid space.*

*Proof.* The second claim of the Lemma follows readily from the first assertion together with the definitions. We are thus reduced to prove that  $t_0(Z)$  is isomorphic to an ordinary  $k$ -affinoid space. Let  $\mathcal{J} \subseteq \pi_0(\mathcal{O}_Z)$ , denote the coherent ideal sheaf associated to the closed immersion  $Z_{\mathrm{red}} \hookrightarrow Z$ . Notice that the ideal  $\mathcal{J}$  agrees with the Jacobson ideal of  $\pi_0(\mathcal{O}_Z)$ . Thanks to our assumption that  $\pi_0(\mathcal{O}_Z)$  is a Noetherian derived  $k$ -algebra on  $\mathcal{Z}$ , it follows that there exists a sufficiently large integer  $n \geq 2$  such that

$$\mathcal{J}^n = 0.$$

Arguing by induction, we can suppose that  $n = 2$ , that is to say that

$$\mathcal{J}^2 = 0.$$

In particular, Remark 2.10 implies that the natural morphism  $Z_{\mathrm{red}} \rightarrow Z$  has the structure of a square-zero extension. The assertion now follows from [20, Proposition 6.1] and its proof.  $\square$

*Remark 2.13.* We observe that the converse of Lemma 2.12 holds true. Indeed, the natural morphism  $Z_{\mathrm{red}} \rightarrow Z$  is a closed immersion. In particular, if  $Z \in \mathrm{dAfd}_k$  we deduce readily that  $Z_{\mathrm{red}} \in \mathrm{Afd}_k$ , as well.

**Lemma 2.14.** *Let  $f: X \rightarrow Y$  be an affine morphism in  $\mathrm{dAn}_k$ . Suppose we are given an admissible open covering*

$$g: \coprod_{j \in J} U_j \rightarrow Y,$$

*where for each  $j \in J$ ,  $U_j \in \mathrm{dAfd}_k$ . For each  $j \in J$ , let*

$$V_j := U_j \times_X Y \in \mathrm{dAfd}_k,$$

*then  $\coprod_{j \in J} V_j \rightarrow Y$  is an admissible open covering by derived  $k$ -affinoid spaces.*

*Proof.* It is clear from our assumption that  $f$  is an affine morphism that for every index  $j \in J$ , the objects  $V_j \in \mathrm{dAfd}_k$ . The claim of the Lemma follows immediately from the observation that both the classes of effective epimorphisms of  $\infty$ -topoi and admissible open immersions of derived  $k$ -analytic spaces are stable under pullbacks, cf. [16, Proposition 6.2.3.15] and [20, Corollary 5.11, Proposition 5.12], respectively.  $\square$

**2.2. Non-archimedean differential geometry.** In this §, we introduce the notion of a nil-isomorphism between derived  $k$ -analytic spaces and study certain important features of such class of morphisms. The results contained in this paragraph will be of crucial importance to the study of analytic formal moduli problems.

**Definition 2.15.** Let  $f: X \rightarrow Y$  be a morphism in  $\mathrm{dAn}_k$ . We say that  $f$  is a *nil-isomorphism* if  $f$  is almost of finite presentation and furthermore  $f_{\mathrm{red}}: X_{\mathrm{red}} \rightarrow Y_{\mathrm{red}}$  is an isomorphism of ordinary  $k$ -analytic spaces. We will denote by  $\mathrm{AnNil}_{X/}$  the full subcategory of  $(\mathrm{dAn}_k)_{X/}$  spanned by nil-isomorphisms  $X \rightarrow Y$ .

**Lemma 2.16.** *Let  $f: X \rightarrow Y$  be a nil-isomorphism of derived  $k$ -analytic spaces. Then:*

- (1) *Given any morphism  $Z \rightarrow Y$  in  $\mathrm{dAn}_k$ , the base change morphism*

$$Z \times_X Y \rightarrow Z,$$

*is an nil-isomorphism, as well;*

- (2)  *$f$  is an affine morphism;*

- (3)  *$f$  is a finite morphism.*

*Proof.* To prove (1), it suffices to prove that the functor  $(-)_{\mathrm{red}}: \mathrm{dAn}_k \rightarrow \mathrm{An}_k^{\mathrm{red}}$  commutes with finite limits. The truncation functor

$$t_0: \mathrm{dAn}_k \rightarrow \mathrm{An}_k,$$

commutes with finite limits, c.f. [22, Proposition 6.2 (5)]. It suffices then to prove that the usual underlying reduced functor

$$(-)_{\mathrm{red}}: \mathrm{An}_k \rightarrow \mathrm{An}_k^{\mathrm{red}},$$

commutes with finite limits. By construction, the latter assertion is equivalent to the claim that the usual complete tensor product of ordinary  $k$ -affinoid algebras commutes with the operation of taking the quotient by the Jacobson radical, which is immediate.

We now prove (2). Let  $Z \rightarrow Y$  be an admissible open immersion such that  $Z$  is a derived  $k$ -affinoid space. We claim that the pullback  $Z \times_X Y$  is again a derived  $k$ -affinoid space. Thanks to Lemma 2.12 we reduce ourselves to prove that  $(Z \times_X Y)_{\mathrm{red}}$  is equivalent to an ordinary  $k$ -affinoid space. Thanks to (1), we deduce that the induced morphism

$$(Z \times_X Y)_{\mathrm{red}} \rightarrow Z_{\mathrm{red}},$$

is an isomorphism of ordinary  $k$ -analytic spaces. In particular,  $(Z \times_X Y)_{\mathrm{red}}$  is a  $k$ -affinoid space. The result now follows by invoking Lemma 2.12 again.

To prove (3), we shall show that the induced morphism on the underlying 0-th truncations  $t_0(X) \rightarrow t_0(Y)$  is a finite morphism of ordinary  $k$ -affinoid spaces. But this follows immediately from the fact that both  $t_0(X)$  and  $t_0(Y)$  can be obtained from the reduced  $X_{\text{red}}$  by means of a finite sequence of square-zero extensions as in Remark 2.10.  $\square$

**Definition 2.17.** A morphism  $X \rightarrow Y$  be a morphism in  $\text{dAn}_k$  is called a *nil-embedding* if the induced morphism of ordinary  $k$ -analytic spaces  $t_0(X) \rightarrow t_0(Y)$  is a closed immersion with nilpotent ideal of definition.

**Proposition 2.18.** *Let  $f: X \rightarrow Y$  be a nil-embedding of derived  $k$ -analytic spaces. Then there exists a sequence of morphisms*

$$X = X_0^0 \hookrightarrow X_0^1 \hookrightarrow \cdots \hookrightarrow X_0^n = X_0 \hookrightarrow X_1 \cdots X_n \hookrightarrow \cdots \hookrightarrow Y,$$

*such that for each  $0 \leq i \leq n$  and  $j \geq 0$ , the morphisms  $X_0^i \hookrightarrow X_0^{i+1}$  and  $X_j \rightarrow X_{j+1}$  have the structure of square-zero extensions. Furthermore, the induced morphisms  $t_{\leq j}(X_j) \rightarrow t_{\leq j}(Y)$  are equivalences of derived  $k$ -analytic spaces, for every  $j \geq 0$ .*

*Proof.* The proof follows the same scheme of reasoning as [11, Proposition 5.5.3]. For the sake of completeness we present the complete argument here. Consider the induced morphism on the underlying truncations

$$t_0(f): t_0(X) \rightarrow t_0(Y).$$

By construction, there exists a sufficiently large integer  $n \geq 0$  such that

$$\mathcal{J}^{n+1} = 0,$$

where  $\mathcal{J} \subseteq \pi_0(\mathcal{O}_Y)$  denotes the ideal associated to the nil-embedding  $t_0(f)$ . Therefore, we can factor the latter as a finite sequence of square-zero extensions of ordinary  $k$ -analytic spaces

$$t_0(X) \hookrightarrow X_0^{\text{ord},0} \hookrightarrow \cdots \hookrightarrow X_0^{\text{ord},n} = t_0(Y),$$

as in the proof of Lemma 2.12. For each  $0 \leq i \leq n$ , we set

$$X_0^i := X \bigsqcup_{t_0(X)} X_0^{\text{ord},i}.$$

By construction, we have that the natural morphism  $t_0(X_0^n) \rightarrow t_0(Y)$  is an isomorphism of ordinary  $k$ -analytic spaces. We now argue by induction on the Postnikov tower associated to the morphism  $f: X \rightarrow Y$ . Suppose that for a certain integer  $i \geq 0$ , we have constructed a derived  $k$ -analytic space  $X_i$  together with morphisms  $g_i: X \rightarrow X_i$  and  $h_i: X_i \rightarrow Y$  such that  $f \simeq h_i \circ g_i$  and the induced morphism

$$t_{\leq i}(X_i) \rightarrow t_{\leq i}(Y)$$

is an equivalence of derived  $k$ -analytic spaces. We shall proceed as follows: by the assumption that  $h_i$  is  $(i+1)$ -connective, we deduce from [20, Proposition 5.34] the existence of a natural equivalence

$$\tau_{\leq i}(\mathbb{L}_{X_i/Y}^{\text{an}}) \simeq 0,$$

in  $\text{Mod}_{\mathcal{O}_{X_i}}$ . Consider the natural fiber sequence

$$h_i^* \mathbb{L}_Y^{\text{an}} \rightarrow \mathbb{L}_{X_i}^{\text{an}} \rightarrow \mathbb{L}_{X_i/Y}^{\text{an}},$$

in  $\text{Mod}_{\mathcal{O}_{X_i}}$ . The natural morphism

$$\mathbb{L}_{X_i/Y}^{\text{an}} \rightarrow \pi_{i+1}(\mathbb{L}_{X_i/Y}^{\text{an}})[i+1],$$

induces a morphism  $\mathbb{L}_{X_i}^{\text{an}} \rightarrow \pi_{i+1}(\mathbb{L}_{X_i/Y}^{\text{an}})[i+1]$ , such that the composite

$$h_i^* \mathbb{L}_Y^{\text{an}} \rightarrow \mathbb{L}_{X_i}^{\text{an}} \rightarrow \pi_{i+1}(\mathbb{L}_{X_i/Y}^{\text{an}})[i+1], \tag{2.1}$$

is null-homotopic, in  $\text{Mod}_{\mathcal{O}_{X_i}}$ . By the universal property of the relative analytic cotangent complex, (2.1) produces a square-zero extension

$$X_i \rightarrow X_{i+1},$$

together with a morphism  $h_{i+1}: X_{i+1} \rightarrow Y$ , factoring  $h_i: X_i \rightarrow Y$ . We are reduced to show that the morphism

$$\mathcal{O}_Y \rightarrow h_{i+1,*}(\mathcal{O}_{X_{i+1}}),$$

is  $(i+2)$ -connective. Consider the commutative diagram

$$\begin{array}{ccccc} h_{i,*}(\pi_{i+1}(\mathbb{L}_{X_i/Y}^{\text{an}}))[i+1] & \longrightarrow & h_{i+1,*}(\mathcal{O}_{X_{i+1}}) & \longrightarrow & h_{i,*}(\mathcal{O}_{X_i}) \\ \uparrow s_i & & \uparrow & & \uparrow \\ \mathcal{J} & \longrightarrow & \mathcal{O}_Y & \longrightarrow & h_*(\mathcal{O}_{X_i}) \\ \uparrow & & \uparrow & & \uparrow \\ \mathcal{J} & \xrightarrow{=} & \mathcal{J} & \longrightarrow & 0 \end{array} \quad (2.2)$$

in  $\text{Mod}_{\mathcal{O}_Y}$ , where both the vertical and horizontal composites are fiber sequences. By our inductive hypothesis,  $\mathcal{J}$  is  $(i+1)$ -connective. Moreover, thanks to [20, Proposition 5.34] we can identify the natural morphism

$$s_i: \mathcal{J} \rightarrow h_{i,*}(\pi_{i+1}(\mathbb{L}_{X_i/Y}^{\text{an}}))[i+1]$$

with the natural morphism  $\mathcal{J} \rightarrow \tau_{\leq i+1}(\mathcal{J})$ . We deduce that the fiber of the morphism  $s_i$  must be necessarily  $(i+2)$ -connective. The latter observation combined with the structure of (2.2) implies that  $h_{i+1}: X_{i+1} \rightarrow Y$  induces an equivalence of derived  $k$ -analytic spaces

$$\mathfrak{t}_{\leq i+1}(X_{i+1}) \rightarrow \mathfrak{t}_{\leq i+1}(Y),$$

as desired.  $\square$

**Corollary 2.19.** *Let  $X \in \text{dAn}_k$ . Then the following assertions hold:*

(1) *The natural morphism*

$$X_{\text{red}} \rightarrow X,$$

*in  $\text{dAn}_k$ , can be approximated by successive square-zero extensions;*

(2) *For each  $n \geq 0$ , the natural morphism*

$$X_{\text{red}} \rightarrow \mathfrak{t}_{\leq n}(X),$$

*can be approximated by a finite number of square-zero extensions.*

*Proof.* Both the assertions of the Corollary follow readily from Proposition 2.18 by observing that the canonical morphisms  $X_{\text{red}} \rightarrow X$  and  $X_{\text{red}} \rightarrow \mathfrak{t}_{\leq n}(X)$  have the structure of nil-embeddings and that in the latter case the finiteness assumption on the Postnikov tower forces the finiteness of the approximation sequence.  $\square$

**Lemma 2.20.** *Let  $f: X \rightarrow Y$  be a finite morphism of derived  $k$ -affinoid spaces. Let  $Z \rightarrow Y$  be an admissible open immersion and denote by*

$$A := \Gamma(X, \mathcal{O}_X^{\text{alg}}), \quad B := \Gamma(Y, \mathcal{O}_Y^{\text{alg}}), \quad C := \Gamma(Z, \mathcal{O}_Z^{\text{alg}}),$$

*the corresponding derived  $k$ -algebras of derived global sections. Consider the base change*

$$Z' := Z \times_Y X \in \text{dAfd}_k.$$

*Then one has a natural equivalence*

$$\Gamma(Z', \mathcal{O}_{Z'}^{\text{alg}}) \simeq A \otimes_B C,$$

in the  $\infty$ -category  $\mathrm{CAlg}_k$ .

*Proof.* Consider the natural morphism of derived  $k$ -algebras

$$\theta: A \otimes_B C \rightarrow \Gamma(Z', \mathcal{O}_{Z'}^{\mathrm{alg}}).$$

Our goal is to show that  $\theta$  is an equivalence. We start by observing that since the morphism  $f: X \rightarrow Y$  is finite, the induced morphism  $B \rightarrow A$  in  $\mathrm{CAlg}_k$  is finite as well. In particular, the (ordinary) complete tensor product coincides with the (ordinary) algebraic tensor product, i.e., the natural morphism

$$\pi_0(A) \otimes_{\pi_0(B)} \pi_0(C) \rightarrow \pi_0(A) \widehat{\otimes}_{\pi_0(B)} \pi_0(C),$$

is an equivalence of ordinary rings. In particular, thanks to [22, Proposition 6.2 (5) and Theorem 6.5] we deduce that

$$\pi_0(A \otimes_B C) \rightarrow \pi_0(\Gamma(Z', \mathcal{O}_{Z'}^{\mathrm{alg}})),$$

is an equivalence of derived rings, as well. In order to conclude, we shall prove that for every  $i > 0$ , the natural morphism

$$\pi_i(A \otimes_B C) \rightarrow \pi_i(\Gamma(Z', \mathcal{O}_{Z'})),$$

is an equivalence. Since the morphism  $f: X \rightarrow Y$  is a finite morphism we deduce that  $\pi_i(\mathcal{O}_X)$  is a coherent  $\pi_0(\mathcal{O}_Y)$ -module, for every  $i \geq 0$ . By unwinding the definitions, we deduce then that

$$\pi_0(\mathcal{O}_Z) \widehat{\otimes}_{\pi_0(\mathcal{O}_Y)} \pi_i(\mathcal{O}_X) \simeq \pi_0(\mathcal{O}_Z) \otimes_{\pi_0(\mathcal{O}_Y)} \pi_i(\mathcal{O}_X),$$

as  $\pi_0(\mathcal{O}_Z)$ -modules. We thus deduce that we have a spectral sequence

$$\pi_*(\mathcal{O}_Z) \otimes_{\pi_*(\mathcal{O}_Y)} \pi_*(\mathcal{O}_X) \rightarrow \pi_*(\mathcal{O}_{Z'}),$$

whose existence is guaranteed by [18, 1.2.2.14]. The result now follows from derived Tate acyclicity theorem, c.f. [21, Theorem 3.1].  $\square$

**Lemma 2.21.** *Let  $f: X \rightarrow Y$  be a finite morphism of derived  $k$ -affinoid spaces and  $g: Z \rightarrow Y$  an admissible open immersion in  $\mathrm{dAfd}_k$ . Form the pullback diagram*

$$\begin{array}{ccc} Z' & \xrightarrow{g'} & X \\ \downarrow f' & & \downarrow f \\ Z & \xrightarrow{g} & Y, \end{array}$$

in the  $\infty$ -category  $\mathrm{dAfd}_k$ . Then the commutative diagram

$$\begin{array}{ccc} \mathrm{Coh}^+(Y) & \xrightarrow{f^*} & \mathrm{Coh}^+(X) \\ \downarrow g^* & & \downarrow (g')^* \\ \mathrm{Coh}^+(Z) & \xrightarrow{(f')^*} & \mathrm{Coh}^+(Z'), \end{array}$$

is right adjointable. In other words, the Beck-Chevalley natural transformation

$$\alpha: g^* \circ f_* \rightarrow (f')_* \circ g'_*$$

is an equivalence of functors.

*Proof.* Since  $f$  is assumed to be a finite morphism of derived  $k$ -affinoid spaces, it follows from the derived Tate acyclicity theorem, c.f. [21, Theorem 3.1] that the right adjoint  $f_*: \mathrm{Coh}^+(X) \rightarrow \mathrm{Coh}^+(Y)$  is well defined. The assertion of the Lemma is now an immediate consequence of Lemma 2.20 together with [19, Proposition 2.5.4.5] and the derived Tate acyclicity theorem.  $\square$

**Proposition 2.22.** *Let  $f: S \rightarrow S'$  be a nil-isomorphism between derived  $k$ -analytic spaces. Then the pullback functor*

$$f^*: \mathrm{Coh}^+(S') \rightarrow \mathrm{Coh}^+(S),$$

*admits a well defined right adjoint,  $f_*$ .*

*Proof.* Since  $f: S \rightarrow S'$  is a nil-isomorphism, we conclude from Lemma 2.16 that  $f$  is an affine morphism between derived  $k$ -analytic spaces. By admissible descent of  $\mathrm{Coh}^+$ , cf. [4, Theorem 3.7], together with Lemma 2.14 and Lemma 2.21 we reduce the statement of the Lemma to the case where both  $S$  and  $S'$  are equivalent to derived  $k$ -affinoid spaces. In this case, the result follows by our assumptions on  $f$  and Lemma 2.16.  $\square$

**Proposition 2.23.** *Let  $f: X \rightarrow Y$  be a nil-embedding of derived  $k$ -analytic spaces. Let  $g: X \rightarrow Z$  be a finite morphism in  $\mathrm{dAn}_k$ . The diagram*

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ \downarrow g & & \\ Z & & \end{array}$$

*admits a pushout in  $\mathrm{dAn}_k$ , denoted  $Z'$ . Moreover, the natural morphism  $Z \rightarrow Z'$  is also a nil-embedding.*

*Proof.* The  $\infty$ -category of  $\mathcal{T}_{\mathrm{an}}(k)$ -structured  $\infty$ -topoi  ${}^{\mathrm{R}}\mathrm{Top}(\mathcal{T}_{\mathrm{an}}(k))$  is a presentable  $\infty$ -category. Consider the pushout diagram

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ \downarrow g & & \downarrow \\ Z & \longrightarrow & Z', \end{array}$$

in the  $\infty$ -category  ${}^{\mathrm{R}}\mathrm{Top}(\mathcal{T}_{\mathrm{an}}(k))$ . By construction, the underlying  $\infty$ -topos of  $Z'$  can be computed as the pushout in the  $\infty$ -category  ${}^{\mathrm{R}}\mathrm{Top}$  of the induced diagram on the underlying  $\infty$ -topoi of  $X$ ,  $Z$  and  $Y$ . Moreover, since  $g$  is a nil-isomorphism it induces an equivalence on underlying  $\infty$ -topoi of both  $X$  and  $Y$ . It follows that the induced morphism  $Z \rightarrow Z'$  in  ${}^{\mathrm{R}}\mathrm{Top}(\mathcal{T}_{\mathrm{an}}(k))$  induces an equivalence on the underlying  $\infty$ -topoi. Moreover, it follows essentially by construction that we have a natural equivalence

$$\begin{aligned} \mathcal{O}_{Z'} &\simeq g_*(\mathcal{O}_Y) \times_{g_*(\mathcal{O}_X)} \mathcal{O}_Z \\ &\in \mathrm{Str}_{\mathcal{T}_{\mathrm{an}}(k)}^{\mathrm{loc}}(Z). \end{aligned}$$

As the morphism  $g_*(\mathcal{O}_Y) \rightarrow g_*(\mathcal{O}_X)$  is an effective epimorphism and effective epimorphisms are preserved under fiber products in an  $\infty$ -topos, c.f. [16, Proposition 6.2.3.15], it follows that the natural morphism

$$\mathcal{O}_{Z'} \rightarrow \mathcal{O}_Z,$$

is an effective epimorphism, as well. Consider now the commutative diagram of fiber sequences

$$\begin{array}{ccccc} \mathcal{J}' & \longrightarrow & \mathcal{O}_{Z'} & \longrightarrow & \mathcal{O}_Z \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{J} & \longrightarrow & g_*(\mathcal{O}_Y) & \longrightarrow & g_*(\mathcal{O}_X), \end{array}$$

in the stable  $\infty$ -category  $\mathrm{Mod}_{\mathcal{O}_Z'}$ . Since the right commutative square is a pullback square it follows that the morphism

$$\mathcal{J}' \rightarrow \mathcal{J},$$

is an equivalence. In particular,  $\pi_0(\mathcal{J}')$  is a finitely generated nilpotent ideal of  $\pi_0(\mathcal{O}_{Z'}^{\mathrm{alg}})$ . Indeed, finitely generation follows from our assumption that  $g$  is a finite morphism. Thanks to Lemma 2.12, it follows that

$t_0(Z')$  is an ordinary  $k$ -analytic space and the morphism  $t_0(Z') \rightarrow t_0(Z)$  is a nil-embedding. We are thus reduced to show that for every  $i > 0$ , the homotopy sheaf  $\pi_i(\mathcal{O}_{Z'}) \in \text{Coh}^+(t_0(Z'))$ . But this follows immediately from the existence of a fiber sequence

$$\mathcal{O}_{Z'} \rightarrow g_*(\mathcal{O}_Y) \oplus \mathcal{O}_Z \rightarrow g_*(\mathcal{O}_X),$$

in the  $\infty$ -category  $\text{Mod}_{\mathcal{O}_{Z'}}$  together with the fact that  $g_*(\mathcal{O}_Y)$  and  $g_*(\mathcal{O}_Z)$  have coherent homotopy sheaves, by our assumption that  $g$  is a finite morphism combined with Lemma 2.16.  $\square$

**Corollary 2.24.** *Let  $f: S \rightarrow S'$  be a square-zero extension and  $g: S \rightarrow T$  a nil-isomorphism in  $\text{dAn}_k$ . Suppose we are given a pushout diagram*

$$\begin{array}{ccc} S & \xrightarrow{f} & S' \\ \downarrow & & \downarrow \\ T & \longrightarrow & T' \end{array},$$

in  $\text{dAn}_k$ . Then the induced morphism  $T \rightarrow T'$  is a square-zero extension.

*Proof.* Since  $g$  is a nil-isomorphism of derived  $k$ -analytic spaces, Proposition 2.22 implies that the pullback functor  $g^*: \text{Coh}^+(T) \rightarrow \text{Coh}^+(S)$  admits a well defined right adjoint

$$g_*: \text{Coh}^+(S) \rightarrow \text{Coh}^+(T).$$

Let  $\mathcal{F} \in \text{Coh}^+(S)^{\geq 0}$  and  $d: \mathbb{L}_S^{\text{an}} \rightarrow \mathcal{F}[1]$  be a derivation associated with the morphism  $f: S \rightarrow S'$ . Consider now the natural composite

$$d': \mathbb{L}_T^{\text{an}} \rightarrow g_*(\mathbb{L}_S^{\text{an}}) \xrightarrow{g_*(d)} g_*(\mathcal{F})[1],$$

in the  $\infty$ -category  $\text{Coh}^+(T)$ . By the universal property of the relative analytic cotangent complex, we deduce the existence of a square-zero extension

$$T \rightarrow T',$$

in the  $\infty$ -category  $\text{dAn}_k$ . Let  $X \in \text{dAn}_k$  together with morphisms  $S' \rightarrow X$  and  $T \rightarrow X$  compatible with both  $f$  and  $g$ . By the universal property of the relative analytic cotangent complex, the morphism  $S' \rightarrow X$  induces a uniquely defined (up to a contractible indeterminacy space) morphism

$$\mathbb{L}_{S'/X}^{\text{an}} \rightarrow \mathcal{F}[1],$$

in  $\text{Coh}^+(S)$ , such that the composite  $\mathbb{L}_S^{\text{an}} \rightarrow \mathbb{L}_{S'/X}^{\text{an}} \rightarrow \mathcal{F}[1]$  agrees with  $d$ . By applying the right adjoint  $g_*$  above we obtain a commutative diagram

$$\begin{array}{ccc} \mathbb{L}_T^{\text{an}} & \xrightarrow{\text{can}} & \mathbb{L}_{T/X}^{\text{an}} \\ \downarrow & & \downarrow \\ g_*(\mathbb{L}_S^{\text{an}}) & \xrightarrow{g_*(\text{can})} & g_*(\mathbb{L}_{S'/X}^{\text{an}}) \longrightarrow g_*(\mathcal{F})[1], \end{array} \quad \begin{array}{c} \searrow d'' \\ \end{array}$$

in the  $\infty$ -category  $\text{Coh}^+(T)$ . From this, we conclude again by the universal property of the relative analytic cotangent complex the existence of a uniquely defined natural morphism  $T' \rightarrow X$  extending both  $T \rightarrow X$  and  $S' \rightarrow X$  and compatible with the restriction to  $S$ . The latter assertion is equivalent to state that the commutative square

$$\begin{array}{ccc} S & \longrightarrow & S' \\ \downarrow & & \downarrow \\ T & \longrightarrow & T', \end{array}$$

is a pushout diagram in  $\text{dAn}_k$ . The proof is thus concluded.  $\square$

*Construction 2.25.* Let  $n \geq 0$ . We have a well defined functor

$$\mathrm{AnNil}_{t_{\leq n}(X)/} \rightarrow \mathrm{AnNil}_{X/},$$

given by the formula

$$(t_{\leq n}(X) \rightarrow S) \in \mathrm{AnNil}_{t_{\leq n}(X)/} \mapsto (X \rightarrow S \bigsqcup_{t_{\leq n}(X)} X).$$

Given any functor  $F: \mathrm{AnNil}_{X/} \rightarrow \mathcal{S}$ , we define  $F^{\leq n}: \mathrm{AnNil}_{t_{\leq n}(X)/} \rightarrow \mathcal{S}$  as the functor given on objects by the association

$$(t_{\leq n}(X) \rightarrow S) \in \mathrm{AnNil}_{t_{\leq n}(X)/} \mapsto F^{\leq n}(S \bigsqcup_{t_{\leq n}(X)} X) \in \mathcal{S}.$$

It follows from the construction that, for each  $n \geq 0$  and  $S \in \mathrm{AnNil}_{X/}$ , we have a natural morphism

$$F(S) \rightarrow F^{\leq n}(t_{\leq n}(S)),$$

in the  $\infty$ -category  $\mathcal{S}$ .

**2.3. Analytic formal moduli problems under a base.** We study the  $\infty$ -category of  $k$ -analytic formal moduli problems under a base  $X \in \mathrm{dAn}_k$  and explore certain important features of such. The results presented here will prove to be crucial for the study of the deformation to the normal cone in the  $k$ -analytic setting, which we treat in the next section. We start with the following central definition:

**Definition 2.26.** An *analytic formal moduli problem under  $X$*  corresponds to the datum of a functor

$$F: (\mathrm{AnNil}_{X/})^{\mathrm{op}} \rightarrow \mathcal{S},$$

satisfying the following two conditions:

- (1)  $F(X) \simeq *$  in  $\mathcal{S}$ ;
- (2) Given any  $S \in \mathrm{AnNil}_{X/}^{\mathrm{op}}$ , the natural morphism

$$F(S) \rightarrow \lim_{n \geq 0} F^{\leq n}(t_{\leq n}(S)),$$

is an equivalence in  $\mathcal{S}$  (see Construction 2.25). In other words,  $F$  is *convergent*;

- (3) Given any pushout diagram

$$\begin{array}{ccc} S & \xrightarrow{f} & S' \\ \downarrow & & \downarrow \\ T & \longrightarrow & T', \end{array}$$

in the  $\infty$ -category  $\mathrm{AnNil}_{X/}$ , such that  $f$  has the structure of a square-zero extension, the induced morphism

$$F(T') \rightarrow F(T) \times_{F(S)} F(S),$$

is an equivalence in  $\mathcal{S}$ .

We shall denote by  $\mathrm{AnFMP}_{X/}$  the full subcategory of  $\mathrm{Fun}((\mathrm{AnNil}_{X/})^{\mathrm{op}}, \mathcal{S})$  spanned by analytic formal moduli problems under  $X$ .

*Remark 2.27.* In the previous definition we remark that the functor

$$F^{\leq n}: \mathrm{AnNil}_{t_{\leq n}(X)/}^{\mathrm{op}} \rightarrow \mathcal{S},$$

is itself an analytic formal moduli problem under  $t_{\leq n}(X)$ .

We shall give some important examples of formal moduli problems under  $X$ :

**Example 2.28.** (1) Let  $X \in \mathrm{dAn}_k$ . As in the algebraic case, we can consider the *de Rham pre-stack associated to  $X$* ,  $X_{\mathrm{dR}}: \mathrm{dAfd}_k^{\mathrm{op}} \rightarrow \mathcal{S}$ , determined by the formula

$$X_{\mathrm{dR}}(Z) := X(Z_{\mathrm{red}}), \quad Z \in \mathrm{dAfd}_k.$$

We have a natural morphism  $X \rightarrow X_{\mathrm{dR}}$  induced from the natural morphism  $Z_{\mathrm{red}} \rightarrow Z$ . The restriction of  $X_{\mathrm{dR}}$  to  $\mathrm{Fun}(\mathrm{AnNil}_{X/}^{\mathrm{op}}, \mathcal{S})$  via the functor

$$h_*: \mathrm{dAnSt}_k \rightarrow \mathrm{AnFMP}_{X/},$$

induced by the inclusion  $h: \mathrm{AnNil}_{X/} \subseteq \mathrm{dAn}_k$ , is an analytic formal moduli problem under  $X$ . Moreover, it follows from the construction of  $X_{\mathrm{dR}}$  that the object  $h_*(X_{\mathrm{dR}})$  is equivalent to a final object in  $\mathrm{AnFMP}_{X/}$ .

- (2) Let  $f: X \rightarrow Y$  be a morphism in the  $\infty$ -category  $\mathrm{dAn}_k$ . We define the *formal completion of  $X$  in  $Y$  along  $f$*  as the pullback

$$\begin{aligned} Y_X^\wedge &:= Y \times_{Y_{\mathrm{dR}}} X_{\mathrm{dR}} \\ &\in \mathrm{dAnSt}_k. \end{aligned}$$

By construction we have a natural factorization  $X \rightarrow Y_X^\wedge \rightarrow Y$  in  $\mathrm{dAnSt}_k$ , and moreover the restriction of  $X \rightarrow Y_X^\wedge$  to the  $\infty$ -category  $\mathrm{Fun}(\mathrm{AnNil}_{X/}^{\mathrm{op}}, \mathcal{S})$  along the natural functor

$$h_*: (\mathrm{dAnSt}_k)_{X/} \rightarrow \mathrm{AnFMP}_{X/},$$

exhibits  $Y_X^\wedge$  as a formal moduli problem under  $X$ .

- (3) Let  $f: X \rightarrow Y$  be a closed immersion in the  $\infty$ -category  $\mathrm{dAn}_k$ . Consider the shifted tangent bundle associated to  $f$  together with the zero section

$$\begin{array}{ccc} X & \xrightarrow{s_0} & \mathbf{T}_{X/Y}^{\mathrm{an}}[1] \\ & \searrow = & \downarrow p \\ & & X. \end{array}$$

The completion  $\mathbf{T}_{X/Y}^{\mathrm{an}}[1]_X^\wedge \in \mathrm{AnFMP}_{X/}$  along  $s_0$  will play an important role in what follows.

**Notation 2.29.** We set  $\mathrm{AnNil}_{X/}^{\mathrm{cl}} \subseteq \mathrm{AnNil}_{X/}$  to be the full subcategory spanned by those objects corresponding to nil-embeddings

$$X \rightarrow S,$$

in  $\mathrm{dAn}_k$ .

**Proposition 2.30.** *Let  $Y \in \mathrm{AnNil}_{X/}$ . The following assertions hold:*

- (1) *The inclusion functor*

$$\mathrm{AnNil}_{X//Y}^{\mathrm{cl}} \hookrightarrow \mathrm{AnNil}_{X//Y},$$

*is cofinal.*

- (2) *The natural morphism*

$$\mathrm{colim}_{Z \in \mathrm{AnNil}_{X//Y}^{\mathrm{cl}}} Z \rightarrow Y,$$

*is an equivalence in  $\mathrm{Fun}(\mathrm{AnNil}_{X/}^{\mathrm{op}}, \mathcal{S})$ .*

- (3) *The  $\infty$ -category  $\mathrm{AnNil}_{X//Y}^{\mathrm{cl}}$  is filtered.*

*Proof.* We start by proving claim (1). Let  $n \geq 0$ , and consider the usual restriction along the natural morphism  $X_{\text{red}} \rightarrow t_{\leq n}(X)$  functor

$$\mathbf{res}^{\leq n}: \text{AnNil}_{t_{\leq n}(X)/} \rightarrow \text{AnNil}_{X_{\text{red}}/}.$$

Such functor admits a well defined left adjoint

$$\mathbf{push}^{\leq n}: \text{AnNil}_{X_{\text{red}}/} \rightarrow \text{AnNil}_{t_{\leq n}(X)/},$$

which is determined by the formula

$$(X_{\text{red}} \rightarrow T) \in \text{AnNil}_{X_{\text{red}}/} \mapsto (t_{\leq n}(X) \rightarrow T') \in \text{AnNil}_{X/},$$

where we have set

$$T' := t_{\leq n}(X) \bigsqcup_{X_{\text{red}}} T \in \text{AnNil}_{X/}. \quad (2.3)$$

We claim that  $T' \in \text{AnNil}_{t_{\leq n}(X)/}$  belongs to the full subcategory  $\text{AnNil}_{t_{\leq n}(X)/}^{\text{cl}} \subseteq \text{AnNil}_{t_{\leq n}(X)/}$ . Indeed, since the structural morphism  $X_{\text{red}} \rightarrow T$ , is necessarily a nil-embedding we deduce the claim from Proposition 2.23. We shall denote by

$$\mathbf{res}_!^{\leq n}(Y): \text{AnNil}_{X_{\text{red}}/}^{\text{op}} \rightarrow \mathcal{S},$$

the left Kan extension of  $Y$  along the functor  $\mathbf{res}^{\leq n}$  above. By the colimit formula for left Kan extensions, c.f. [16, Lemma 4.3.2.13], it follows that  $\mathbf{res}_!^{\leq n}(Y)$  is given by the formula

$$(X_{\text{red}} \rightarrow T) \in \text{AnNil}_{X_{\text{red}}/} \mapsto Y^{\leq n}(T') \in \mathcal{S},$$

where  $T'$  is as in (2.3). We thus have a diagram of functors

$$\mathbf{res}^{\leq n}: \text{AnNil}_{t_{\leq n}(X)/Y^{\leq n}} \rightleftarrows \text{AnNil}_{X_{\text{red}}//\mathbf{res}_!^{\leq n}(Y)}: \mathbf{push}^{\leq n},$$

where  $\mathbf{res}^{\leq n}$  is given on objects by the formula

$$(t_{\leq n}(X) \rightarrow S \rightarrow Y^{\leq n}) \in \text{AnNil}_{t_{\leq n}(X)/Y^{\leq n}} \mapsto (X_{\text{red}} \rightarrow S \rightarrow \mathbf{res}_!^{\leq n}(Y)) \in \text{AnNil}_{X_{\text{red}}//\mathbf{res}_!^{\leq n}(Y)}$$

and the functor  $\mathbf{push}^{\leq n}$  is given by the association

$$(X_{\text{red}} \rightarrow T \rightarrow Y^{\leq n}) \in \text{AnNil}_{X_{\text{red}}//Y^{\leq n}} \mapsto (t_{\leq n}(X) \rightarrow T \sqcup_{X_{\text{red}}} t_{\leq n}(X) \rightarrow Y^{\leq n}) \in \text{AnNil}_{t_{\leq n}(X)/Y^{\leq n}}.$$

We claim that the pair  $(\mathbf{res}^{\leq n}, \mathbf{push}^{\leq n})$  forms an adjunction. Indeed, a morphism

$$(X_{\text{red}} \rightarrow S \rightarrow \mathbf{res}_!^{\leq n}(Y)) \rightarrow \mathbf{res}_!^{\leq n}(t_{\leq n}(X) \rightarrow T \rightarrow Y^{\leq n}),$$

corresponds to a commutative diagram

$$\begin{array}{ccccc} X_{\text{red}} & \longrightarrow & S & \longrightarrow & \mathbf{res}_!^{\leq n}(Y) \\ \downarrow = & & \downarrow & & \downarrow = \\ X_{\text{red}} & \longrightarrow & T & \longrightarrow & \mathbf{res}_!^{\leq n}(Y), \end{array}$$

in the  $\infty$ -category  $\mathrm{Fun}(\mathrm{AnNil}_{X_{\mathrm{red}}}^{\mathrm{op}}, \mathcal{S})$ . The latter datum is equivalent to the datum of a commutative diagram

$$\begin{array}{ccccccc}
 & & & & t_{\leq n}(X) & & \\
 & & & & \downarrow & \searrow & \\
 X_{\mathrm{red}} & \longrightarrow & S & \longrightarrow & S' & \longrightarrow & Y^{\leq n} \\
 \downarrow & & \downarrow & & \downarrow & & \downarrow = \\
 X_{\mathrm{red}} & \longrightarrow & T & \longrightarrow & T' & \longrightarrow & Y^{\leq n}
 \end{array} \quad (2.4)$$

Since the morphism  $t_{\leq n}(X) \rightarrow T'$  factors through the structural map

$$t_{\leq n}(X) \rightarrow T,$$

we deduce that the datum of (2.4) is equivalent to the datum of a commutative diagram

$$\begin{array}{ccccc}
 t_{\leq n}(X) & \longrightarrow & S' & \longrightarrow & Y^{\leq n} \\
 \downarrow & & \downarrow & & \downarrow = \\
 t_{\leq n}(X) & \longrightarrow & T & \longrightarrow & Y^{\leq n},
 \end{array}$$

which corresponds to a uniquely well defined morphism

$$\mathbf{push}^{\leq n}(X_{\mathrm{red}} \rightarrow S \rightarrow \mathbf{res}_!^{\leq n}(Y)) \rightarrow (t_{\leq n}(Y) \rightarrow T \rightarrow Y^{\leq n}),$$

in the  $\infty$ -category  $\mathrm{AnNil}_{t_{\leq n}(X)//Y^{\leq n}}$ . We further observe that for every  $n \geq m \geq 0$ , the objects

$$\mathbf{res}_!^{\leq n}(Y) \quad \text{and} \quad \mathbf{res}_!^{\leq m}(Y),$$

are equivalent as functors  $\mathrm{AnNil}_{X_{\mathrm{red}}}^{\mathrm{op}} \rightarrow \mathcal{S}$ , we shall denote this functor simply by  $\mathbf{res}_!(Y)$ .

Passing to the limit over  $n \geq 0$  we obtain a commutative diagram of the form

$$\begin{array}{ccc}
 \mathrm{AnNil}_{X_{\mathrm{red}}//\mathbf{res}_!(Y)} & \xrightarrow{\quad\quad\quad} & \lim_{n \geq 0} \mathrm{AnNil}_{t_{\leq n}(X)//Y^{\leq n}} \\
 & \searrow \quad \quad \nearrow & \\
 & \mathrm{AnNil}_{X//Y} &
 \end{array}$$

The horizontal morphism is cofinal since it fits into an adjunction, by our previous considerations. Thanks to [16, Corollary 4.1.1.9] in order to show that the natural morphism

$$\mathrm{AnNil}_{X_{\mathrm{red}}//\mathbf{res}_!(Y)} \rightarrow \mathrm{AnNil}_{X//Y},$$

is cofinal, it suffices to prove that  $\mathrm{AnNil}_{X//Y} \rightarrow \lim_{n \geq 0} \mathrm{AnNil}_{t_{\leq n}(X)//Y^{\leq n}}$  is itself cofinal. But the latter is an immediate consequence of the fact that derived  $k$ -analytic spaces are nilcomplete, c.f. [20, Lemma 7.7], combined with assumption (3) in Definition 2.26. Assertion (1) of the Proposition now follows from the observation that the functor

$$\mathrm{AnNil}_{X_{\mathrm{red}}//\mathbf{res}_!(Y)} \rightarrow \mathrm{AnNil}_{X//Y},$$

factors through the full subcategory  $\mathrm{AnNil}_{X//Y}^{\mathrm{cl}} \subseteq \mathrm{AnNil}_{X//Y}$ .

Claim (2) follows immediately from (1) combined with Yoneda Lemma. To prove (3) we shall make use of [16, Lemma 5.3.1.12]. Let

$$F: \partial \Delta^n \rightarrow \mathrm{AnNil}_{X//Y}^{\mathrm{cl}}.$$

For each  $[m] \in \Delta^n$ , denote by  $S_m := F([m])$  in  $\text{AnNil}_{X/Y}^{\text{cl}}$ . The pushout

$$S_n \bigsqcup_X S_{n-1},$$

exists in  $\text{AnNil}_{X/Y}^{\text{cl}}$ . We wish to show that  $S_n \bigsqcup_X S_{n-1}$  admits a morphism

$$S_n \bigsqcup_X S_{n-1} \rightarrow Y,$$

compatible with the diagram  $F$ . In order to prove the latter assertion, we observe that Proposition 2.18 can filter the diagram  $F$  by diagrams  $F_i \rightarrow F$  such that  $X \rightarrow F_0$  is formed by square-zero extensions and so are each transition morphisms  $F_i \rightarrow F_{i+1}$ . This implies that for every  $j \geq 0$ , we can find morphisms

$$t_{\leq j}(S_n) \bigsqcup_{t_{\leq j}(X)} t_{\leq j}(S_{n-1}) \rightarrow Y^{\leq j},$$

which are compatible for varying  $j \geq 0$ . Moreover, the fact that  $Y$  satisfies condition (2) in Definition 2.26 implies that we can find a well defined morphism

$$S_n \bigsqcup_X S_{n-1} \rightarrow Y,$$

which is compatible with  $F$ , as desired.  $\square$

As a Corollary we deduce the following important result:

**Corollary 2.31.** *Let  $X \in \text{dAn}_k$ , then the  $\infty$ -category  $\text{AnFMP}_{X/}$  is presentable. In particular, the latter admits all small colimits.*

*Proof.* Consider the fully faithful functor

$$\text{AnNil}_{X/}^{\text{cl}} \hookrightarrow \text{AnNil}_{X/} \rightarrow \text{AnFMP}_{X/}.$$

It follows from the definitions that the  $\infty$ -category  $\text{AnFMP}_{X/}$  admits filtered colimits. In particular, we obtain a well defined functor

$$F: \text{Ind}(\text{AnNil}_{X/}^{\text{cl}}) \rightarrow \text{AnFMP}_{X/},$$

which is further fully faithful, since every the image of every  $(X \rightarrow S) \in \text{AnNil}_{X/}$  is compact in  $\text{AnFMP}_{X/}$ . It follows from Proposition 2.30 that  $F$  itself is essentially surjective. Since the  $\infty$ -category  $\text{AnNil}_{X/}^{\text{cl}}$  is essentially small we are reduced to show that  $\text{AnFMP}_{X/}$  admits all small colimits. We already know that  $\text{AnFMP}_{X/}$  admits filtered colimits. We shall prove that  $\text{AnFMP}_{X/}$  admits finite colimits as well. As a consequence of Proposition 2.23, we deduce that the  $\infty$ -category  $\text{AnNil}_{X/}^{\text{cl}}$  admits all finite colimits. It is now clear that  $\text{AnFMP}_{X/}$  admits finite colimits as well, and the proof is concluded.  $\square$

**Definition 2.32.** Let  $Y \in \text{AnFMP}_{X/}$  denote an analytic formal moduli problem under  $X$ . The *relative pro-analytic cotangent complex of  $Y$  under  $X$*  is defined as the pro-object

$$\begin{aligned} \mathbb{L}_{X/Y}^{\text{an}} &:= \{\mathbb{L}_{X/Z}^{\text{an}}\}_{Z \in \text{AnNil}_{X/Y}^{\text{cl}}} \\ &\in \text{Pro}(\text{Coh}^+(X)), \end{aligned}$$

where, for each  $Z \in \text{AnNil}_{X/Y}^{\text{cl}}$

$$\mathbb{L}_{X/Z}^{\text{an}} \in \text{Coh}^+(X),$$

denotes the usual relative analytic cotangent complex associated to the structural morphism  $X \rightarrow Z$  in  $\text{AnNil}_{X/Y}^{\text{cl}}$ .

*Remark 2.33.* Let  $Y \in \text{AnFMP}_{X/}$ . For a general  $Z \in \text{dAn}_k$ , there exists a natural morphism

$$\mathbb{L}_X^{\text{an}} \rightarrow \mathbb{L}_{X/Z}^{\text{an}},$$

in the  $\infty$ -category  $\text{Coh}^+(X)$ . Passing to the limit over  $Z \in \text{AnNil}_{X//Y}^{\text{cl}}$ , we obtain a natural map

$$\mathbb{L}_X^{\text{an}} \rightarrow \mathbb{L}_{X/Y}^{\text{an}},$$

in  $\text{Pro}(\text{Coh}^+(X))$ , as well.

The following result justifies our choice of terminology for the object  $\mathbb{L}_{X/Y}^{\text{an}} \in \text{Pro}(\text{Coh}^+(X))$ :

**Lemma 2.34.** *Let  $Y \in \text{AnFMP}_{X/}$ . Let  $X \hookrightarrow S$  be a square-zero extension associated to an analytic derivation*

$$d: \mathbb{L}_S^{\text{an}} \rightarrow \mathcal{F}[1],$$

*where  $\mathcal{F} \in \text{Coh}^+(X)^{\geq 0}$ . Then there exists a natural morphism*

$$\text{Map}_{\text{AnFMP}_{X/}}(S, Y) \rightarrow \text{Map}_{\text{Pro}(\text{Coh}^+(X))}(\mathbb{L}_{X/Y}^{\text{an}}, \mathcal{F}) \times_{\text{Map}_{\text{Coh}^+(X)}(\mathbb{L}^{\text{an}}, \mathcal{F})} \{d\}$$

*which is furthermore an equivalence in the  $\infty$ -category  $\mathcal{S}$ .*

*Proof.* Thanks to Proposition 2.30 combined with the Yoneda Lemma we can identify the space of liftings of the map  $X \rightarrow Y$  along  $X \rightarrow S$  with the mapping space

$$\text{Map}_{\text{AnFMP}_{X/}}(S, Y) \simeq \text{colim}_{Z \in \text{AnNil}_{X//Y}^{\text{cl}}} \text{Map}_{\text{AnNil}_{X/}}(S, Z).$$

Fix  $Z \in \text{AnNil}_{X//Y}^{\text{cl}}$ . Then we have a natural identification of mapping spaces

$$\text{Map}_{\text{AnNil}_{X/}}(S, Z) \simeq \text{Map}_{(\text{dAn}_k)_{X/}}(S, Z) \tag{2.5}$$

$$\simeq \text{Map}_{\text{Coh}^+(X)}(\mathbb{L}_{X/Z}^{\text{an}}, \mathcal{F}) \times_{\text{Map}_{\text{Coh}^+(X)}(\mathbb{L}_X^{\text{an}}, \mathcal{F})} \{d\}, \tag{2.6}$$

see [20, §5.4] for a justification of the latter assertion. Passing to the colimit over  $Z \in \text{AnNil}_{X//Y}^{\text{cl}}$ , we conclude thanks to the formula for mapping spaces in pro- $\infty$ -categories that we have a natural equivalence

$$\text{Map}_{\text{AnFMP}_{X/}}(S, Y) \simeq \text{Map}_{\text{Pro}(\text{Coh}^+(X))}(\mathbb{L}_{X/Y}^{\text{an}}, \mathcal{F}) \times_{\text{Map}_{\text{Coh}^+(X)}(\mathbb{L}^{\text{an}}, \mathcal{F})} \{d\},$$

as desired.  $\square$

*Construction 2.35.* Let  $f: Y \rightarrow Z$  denote a morphism in  $\text{AnFMP}_{X/}$ . Then, for every  $S \in \text{AnNil}_{X//Y}^{\text{cl}}$ , the induced morphism

$$S \rightarrow Z,$$

in  $\text{AnFMP}_{X/}$  factors necessarily through some  $S' \in \text{AnNil}_{X//Z}^{\text{cl}}$ . For this reason, we obtain a natural morphism

$$\mathbb{L}_{X/S'}^{\text{an}} \rightarrow \mathbb{L}_{X/S}^{\text{an}},$$

in the  $\infty$ -category  $\text{Coh}^+(X)$ . Passing to the limit over  $S \in \text{AnNil}_{X//Y}^{\text{cl}}$  we obtain a canonically defined morphism

$$\theta(f): \mathbb{L}_{X/Z}^{\text{an}} \rightarrow \mathbb{L}_{X/Y}^{\text{an}},$$

in  $\text{Pro}(\text{Coh}^+(X))$ . Moreover, this association is functorial and thus we obtain a well defined functor

$$\mathbb{L}_{X/\bullet}^{\text{an}}: \text{AnFMP}_{X/} \rightarrow \text{Pro}(\text{Coh}^+(X)),$$

given by the formula

$$(X \rightarrow Y) \in \text{AnFMP}_{X/} \mapsto \mathbb{L}_{X/Y}^{\text{an}} \in \text{Pro}(\text{Coh}^+(X)).$$

**Proposition 2.36.** *Let  $X \in \mathrm{dAn}_k$  be a derived  $k$ -analytic space. Then the functor*

$$\mathbb{L}_{X/\bullet}^{\mathrm{an}}: \mathrm{AnFMP}_{X/} \rightarrow \mathrm{Pro}(\mathrm{Coh}^+(X)),$$

*obtained via Construction 2.35, is conservative.*

*Proof.* Let  $f: Y \rightarrow Z$  be a morphism in  $\mathrm{AnFMP}_{X/}$ . Thanks to Proposition 2.30 we are reduced to show that given any

$$S \in \mathrm{AnNil}_{X//Z}^{\mathrm{cl}},$$

the structural morphism  $g_S: X \rightarrow S$  admits a unique extension  $S \rightarrow Y$  which factors the structural morphism  $X \rightarrow Z$ . Thanks to Proposition 2.18 we can reduce ourselves to the case where  $X \rightarrow S$  has the structure of a square-zero extension. In this case, the result follows from Lemma 2.34 combined with our hypothesis.  $\square$

Our goal now is to give an alternative description of analytic formal moduli problems under  $X \in \mathrm{dAn}_k$ , in terms of derived  $k$ -analytic stacks:

*Construction 2.37.* Consider the  $\infty$ -category of derived  $k$ -analytic stacks,  $\mathrm{dAnSt}_k$ . We have a natural functor

$$h: \mathrm{AnNil}_{X/} \rightarrow \mathrm{dAn}_k \hookrightarrow \mathrm{dAnSt}_k.$$

Therefore, given any derived  $k$ -analytic stack  $Y$  equipped with a morphism  $X \rightarrow Y$ , one can consider its restriction to the  $\infty$ -category  $\mathrm{AnNil}_{X/}$ :

$$Y \circ h: \mathrm{AnNil}_{X/}^{\mathrm{op}} \rightarrow \mathcal{S}.$$

We have thus a natural restriction functor

$$h_*: \mathrm{dAnSt}_k \rightarrow \mathrm{Fun}(\mathrm{AnNil}_{X/}^{\mathrm{op}}, \mathcal{S}).$$

On the other hand, Proposition 2.30 allows us to define a natural functor

$$F: \mathrm{AnNil}_{X/}^{\mathrm{op}} \rightarrow \mathrm{dAnSt}_k$$

via the formula

$$(X \rightarrow Y) \in \mathrm{AnFMP}_{X/} \mapsto \operatorname{colim}_{S \in \mathrm{AnNil}_{X//Y}^{\mathrm{cl}}} S,$$

the colimit being computed in the  $\infty$ -category  $\mathrm{dAnSt}_k$ . The latter agrees with the left Kan extension of the functor

$$h: \mathrm{AnNil}_{X/} \rightarrow \mathrm{dAnSt}_k,$$

along the natural inclusion functor  $\mathrm{AnNil}_{X/} \hookrightarrow \mathrm{AnFMP}_{X/}$ . In particular, any analytic formal moduli under  $X$  when regarded as a derived  $k$ -analytic stack can be realized as an *ind-inf*-object, i.e. it can be written as a filtered colimit of nil-embeddings  $X \rightarrow Z$ . We refer the reader to [11, §1] for a precise meaning of the latter notion in the algebraic setting.

**Definition 2.38.** Let  $f: X \rightarrow Y$  be a morphism in the  $\infty$ -category  $\mathrm{dAnSt}_k$ . We shall say that  $f$  has a *deformation theory* if it satisfies the following conditions:

- (1) Both  $X$  and  $Y$  is *nilcomplete*, c.f. [20, Definition 7.4];
- (2)  $Y$  is *infinitesimally cartesian* if it satisfies [20, Definition 7.3];
- (3) The morphism  $f: X \rightarrow Y$  admits a relative *analytic pro-cotangent complex*, i.e., if it satisfies [20, Definition 7.6] under the weaker assumption that the corresponding derivation functor is pro-corepresentable.

**Proposition 2.39.** *Let  $Y \in (\mathrm{dAnSt}_k)_{X/}$ . Assume further that  $Y$  admits a deformation theory. Then  $Y$  is equivalent to an analytic formal moduli problem under  $X$ .*

*Proof.* We must prove that given a pushout diagram

$$\begin{array}{ccc} S & \xrightarrow{f} & S' \\ \downarrow g & & \downarrow \\ T & \longrightarrow & T' \end{array}$$

in the  $\infty$ -category  $\mathrm{AnNil}_{X/}$ , where  $f$  has the structure of a square-zero extension, then the natural morphism

$$Y(T') \rightarrow Y(T) \times_{Y(S)} Y(S'),$$

is an equivalence in the  $\infty$ -category  $\mathcal{S}$ . Suppose further that  $S \hookrightarrow S'$  is associated to some analytic derivation

$$d: \mathbb{L}_S^{\mathrm{an}} \rightarrow \mathcal{F}[1],$$

for some  $\mathcal{F} \in \mathrm{Coh}^+(S)^{\geq 0}$ . Thanks to Corollary 2.24 we deduce that the induced morphism  $T \rightarrow T'$  admits a structure of a square-zero extension, as well. Then, by our assumptions that  $Y$  is infinitesimally cartesian and it admits a relative pro-cotangent complex, we obtain a chain of natural equivalences of the form

$$\begin{aligned} Y(T') &\simeq \bigsqcup_{f: T \rightarrow Y} \mathrm{Map}_{T/}(T', Y) \\ &\simeq \bigsqcup_{f: T \rightarrow Y} \mathrm{Map}_{\mathrm{Pro}(\mathrm{Coh}^+(T))_{\mathbb{L}_T^{\mathrm{an}}/}}(\mathbb{L}_{T/Y}^{\mathrm{an}}, g_*(\mathcal{F})[1]) \\ &\simeq \bigsqcup_{f: T \rightarrow Y} \mathrm{Map}_{\mathrm{Pro}(\mathrm{Coh}^+(S))_{g^*\mathbb{L}_T^{\mathrm{an}}/}}(g^*\mathbb{L}_{T/Y}^{\mathrm{an}}, \mathcal{F}[1]) \\ &\simeq \bigsqcup_{f: T \rightarrow Y} \mathrm{Map}_{\mathrm{Pro}(\mathrm{Coh}^+(S))_{\mathbb{L}_S^{\mathrm{an}}/}}(\mathbb{L}_{S/Y}^{\mathrm{an}}, \mathcal{F}[1]) \\ &\simeq \bigsqcup_{f: T \rightarrow Y} \mathrm{Map}_{S/}(S', Y) \\ &\simeq Y(T) \times_{Y(S)} Y(S'), \end{aligned}$$

where only the fourth equivalence requires an additional justification, namely: it follows from the existence of a commutative diagram between fiber sequences

$$\begin{array}{ccccc} g^* f^* \mathbb{L}_Y^{\mathrm{an}} & \longrightarrow & g^* \mathbb{L}_T^{\mathrm{an}} & \longrightarrow & g^* \mathbb{L}_{T/Y}^{\mathrm{an}} \\ \downarrow = & & \downarrow & & \downarrow \\ (f \circ g)^* \mathbb{L}_Y^{\mathrm{an}} & \longrightarrow & \mathbb{L}_S^{\mathrm{an}} & \longrightarrow & \mathbb{L}_{S/Y}^{\mathrm{an}}, \end{array}$$

in the  $\infty$ -category  $\mathrm{Pro}(\mathrm{Coh}^+(S))$  combined with the fact that the derivation  $d_T: \mathbb{L}_T^{\mathrm{an}} \rightarrow g_*(\mathcal{F})[1]$  is induced from

$$d: \mathbb{L}_S^{\mathrm{an}} \rightarrow \mathcal{F}[1],$$

as in the proof of Corollary 2.24. The result now follows.  $\square$

**Proposition 2.40.** *Let  $Z \in (\mathrm{dAnSt}_k)_{X/}$  such that the structural morphism  $X \rightarrow Z$  is a nil-isomorphism and assume that  $Z$  admits a deformation theory. Then the natural morphism*

$$\mathrm{colim}_{S \in \mathrm{AnNil}_{X/Z}^{\mathrm{cl}}} S \rightarrow Z,$$

*in the  $\infty$ -category  $(\mathrm{dAnSt}_k)_{/X}$ , is an equivalence.*

*Proof.* We shall prove that for every derived  $k$ -analytic space  $T \in \mathbf{dAn}_k$ , any diagram of the form

$$\begin{array}{ccc} X & \xrightarrow{f} & Z \\ & \searrow g \quad \nearrow h & \\ & T & \end{array},$$

factors through an object

$$X \rightarrow S \rightarrow Z,$$

in  $\mathbf{AnNil}_{X//Z}^{\text{cl}}$ . Consider the commutative diagram

$$\begin{array}{ccccc} X_{\text{red}} & \longrightarrow & T_{\text{red}} & & \\ \downarrow & & \downarrow & \searrow & \\ X & \longrightarrow & T & \longrightarrow & Z, \end{array} \quad (2.7)$$

in the  $\infty$ -category  $\mathbf{dAnSt}_k$ . Since  $Z_{\text{red}} \simeq X_{\text{red}}$  we obtain that  $T_{\text{red}} \rightarrow Z$  factors necessarily through the colimit

$$\operatorname{colim}_{S \in \mathbf{AnNil}_{X//Z}^{\text{cl}}} S \in \mathbf{AnPreStk}.$$

Assume first that  $T$  is bounded, i.e.  $T \in \mathbf{dAn}_k^{<\infty}$ . Then we can construct  $T$  out of  $T_{\text{red}}$  via a finite sequence of square-zero extensions, as in Proposition 2.18. Therefore, in order to construct a factorization

$$T \rightarrow S \rightarrow Z,$$

in  $\mathbf{AnPreStk}_{X/}$ , we reduce ourselves to the case where the morphism  $T_{\text{red}} \rightarrow T$  is itself a square-zero extension. In this case, let

$$d: \mathbb{L}_{T_{\text{red}}}^{\text{an}} \rightarrow \mathcal{F}[1],$$

where  $\mathcal{F} \in \mathbf{Coh}^+(T_{\text{red}})^{\geq 0}$  be the associated derivation. The existence of the diagram (2.7) implies that we have a commutative diagram of the form

$$\begin{array}{ccccc} g^* \mathbb{L}_{T_{\text{red}}}^{\text{an}} & \longrightarrow & \mathbb{L}_{X_{\text{red}}}^{\text{an}} & \longrightarrow & \mathbb{L}_{X_{\text{red}}/T_{\text{red}}}^{\text{an}} \\ \uparrow & & \uparrow & & \uparrow \\ f^* \mathbb{L}_Z^{\text{an}} & \longrightarrow & \mathbb{L}_{X_{\text{red}}}^{\text{an}} & \longrightarrow & \mathbb{L}_{X_{\text{red}}/Z}^{\text{an}}, \end{array}$$

in the  $\infty$ -category  $\mathbf{Pro}(\mathbf{Coh}^+(X))$ . For this reason, the limit-colimit formula for mapping spaces in pro- $\infty$ -categories implies that the natural morphism

$$\mathbb{L}_{X_{\text{red}}/Z}^{\text{an}} \rightarrow \mathbb{L}_{X_{\text{red}}/T_{\text{red}}}^{\text{an}},$$

in the  $\infty$ -category  $\mathbf{Pro}(\mathbf{Coh}^+(X))$  factors necessarily via a morphism of the form

$$\mathbb{L}_{X_{\text{red}}/S}^{\text{an}} \rightarrow \mathbb{L}_{X_{\text{red}}/T_{\text{red}}}^{\text{an}},$$

for some suitable  $S \in \mathbf{AnNil}_{X//Z}^{\text{cl}}$ . Thus the existence problem

$$\begin{array}{ccccc} T_{\text{red}} & \longrightarrow & T & & \\ \downarrow & & \downarrow & \searrow & \\ X_{\text{red}} = S_{\text{red}} & \longrightarrow & S & \longrightarrow & Z, \end{array}$$

admits a solution  $T \rightarrow S \rightarrow Z$ , as desired. If  $T \in \mathbf{dAn}_k$  is a general derived  $k$ -analytic space, we reduce ourselves to the bounded case using the fact that  $Z$  is nilcomplete.  $\square$

**Corollary 2.41.** *The functor*

$$F: \text{AnFMP}_{X/} \rightarrow (\text{dAnSt}_k)_{X/},$$

*is fully faithful. Moreover, its essential image coincides with those  $Z \in (\text{dAnSt}_k)_{X/}$  which admit deformation theory.*

*Proof.* Let  $(\text{dAnSt}_k)_{X/}^{\text{def}} \subseteq (\text{dAnSt}_k)_{X/}$  denote the full subcategory spanned by derived  $k$ -analytic stacks under  $X$  admitting a deformation theory. It is clear that the natural functor

$$F: \text{AnFMP}_{X/} \rightarrow (\text{dAnSt}_k)_{X/},$$

factors through the full subcategory  $(\text{dAnSt}_k)_{X/}^{\text{def}}$ . Moreover, the restriction functor

$$\text{res}: (\text{dAnSt}_k)_{X/}^{\text{def}} \rightarrow \text{Fun}(\text{AnNil}_{X/}^{\text{op}}, \mathcal{S}),$$

factors through  $\text{AnFMP}_{X/} \subseteq \text{Fun}(\text{AnNil}_{X/}^{\text{op}}, \mathcal{S})$ . Moreover, Proposition 2.40 implies that the restriction functor that  $F$  and  $\text{res}$  are mutually inverse functors, proving the claim.  $\square$

**2.4. Analytic formal moduli problems over a base.** Let  $X \in \text{dAn}_k$  denote a derived  $k$ -analytic space. In [23, Definition 6.11] the authors introduced the  $\infty$ -category of *analytic formal moduli problems over  $X$* , which we shall review:

**Notation 2.42.** Let  $X \in \text{dAn}_k$ . We shall denote by  $\text{AnNil}_{/X}$  the full subcategory of  $(\text{dAn}_k)_{/X}$  spanned by nil-isomorphisms

$$Z \rightarrow X,$$

in the  $\infty$ -category  $\text{dAn}_k$ .

**Definition 2.43.** We denote by  $\text{AnFMP}_{/X} \subseteq \text{Fun}(\text{AnNil}_{/X}^{\text{op}}, \mathcal{S})$  the full subcategory spanned by those functors  $Y: \text{AnNil}_{/X}^{\text{op}} \rightarrow \mathcal{S}$  satisfying the following:

- (1)  $Y(X_{\text{red}}) \simeq *$ ;
- (2) The natural morphism

$$Y(S) \rightarrow \lim_{n \geq 1} Y(\text{t}_{\leq n}(S)),$$

induced by the natural inclusion morphisms  $\text{t}_{\leq n}(S) \rightarrow S$  for each  $n \geq 0$ , is an equivalence in  $\mathcal{S}$ ;

- (3) For each pushout diagram

$$\begin{array}{ccc} S & \xrightarrow{f} & S' \\ \downarrow g & & \downarrow \\ T & \longrightarrow & T', \end{array}$$

in  $\text{AnNil}_{/X}$ , for which  $f$  has the structure of a square-zero extension, the canonical morphism

$$Y(T') \rightarrow Y(T) \times_{Y(S)} Y(S'),$$

is an equivalence in  $\mathcal{S}$ .

**Definition 2.44.** We shall denote by  $\text{AnNil}_{/X}^{\text{cl}} \subseteq \text{AnNil}_{/X}$  the faithful subcategory in which we allow morphisms

$$i: S \rightarrow S',$$

where  $i$  is a nil-embedding in  $\text{dAn}_k$ .

We start with the analogue of Proposition 2.30 in the setting of analytic formal moduli problems over  $X$ :

**Proposition 2.45.** *Let  $Y \in \text{AnFMP}_{/X}$ . The following assertions hold:*

(1) *The inclusion functor*

$$(\mathrm{AnNil}_{/X}^{\mathrm{cl}})_{/Y} \rightarrow (\mathrm{AnNil}_{/X})_{/Y},$$

*is cofinal.*

(2) *The natural morphism*

$$\mathrm{colim}_{Z \in (\mathrm{AnNil}_{/X}^{\mathrm{cl}})_{/Y}} Z \rightarrow Y,$$

*is an equivalence in the  $\infty$ -category  $\mathrm{AnFMP}_{/X}$ .*

(3) *The  $\infty$ -category  $\mathrm{AnNil}_{/X}^{\mathrm{cl}}$  is filtered.*

We shall refer to objects in  $\mathrm{AnFMP}_{/X}$  as formal moduli problems over  $X$ .

*Proof.* We first prove assertion (1). Let  $S \rightarrow Z$  be a morphism in  $(\mathrm{AnNil}_{/X}^{\mathrm{cl}})_{/Y}$ . Consider the pushout diagram

$$\begin{array}{ccc} S_{\mathrm{red}} & \longrightarrow & S \\ \downarrow & & \downarrow \\ Z & \longrightarrow & Z', \end{array} \tag{2.8}$$

in the  $\infty$ -category  $\mathrm{AnNil}_{/X}$  whose existence is guaranteed by Proposition 2.23. Since the upper horizontal morphism in (2.8) is a nil-embedding combined with the fact that  $Y$  is itself convergent, we can reduce ourselves via Proposition 2.18 to the case where the latter is an actual square-zero extension. Since  $Y$  is assumed to be an analytic formal moduli problem over  $X$  we then deduce that the canonical morphism

$$\begin{aligned} Y(Z') &\rightarrow Y(Z) \times_{Y(S_{\mathrm{red}})} Y(S) \\ &\simeq Y(Z) \times Y(S), \end{aligned}$$

is an equivalence (we implicitly used above the fact that  $S_{\mathrm{red}} \simeq X_{\mathrm{red}}$ ). As a consequence the object  $(Z' \rightarrow X)$  in  $\mathrm{AnNil}_{/X}$  admits an induced morphism  $Z' \rightarrow Y$  making the required diagram commute. Thanks to Proposition 2.23 we deduce that both  $S \rightarrow Z'$  and  $Z \rightarrow Z'$  are nil-embeddings. Therefore, we can factor the diagram

$$\begin{array}{ccc} S & \xrightarrow{\quad} & Z \\ & \searrow \quad \swarrow & \\ & Y & \end{array}$$

via a closed nil-isomorphism  $Z \rightarrow Z'$ . As a consequence, we deduce readily that the inclusion functor

$$(\mathrm{AnNil}_{/X}^{\mathrm{cl}})_{/Y} \rightarrow (\mathrm{AnNil}_{/X})_{/Y},$$

is cofinal. Assertion (2) is now an immediate consequence of (1). We now prove (3). Let

$$\theta: K \rightarrow (\mathrm{AnNil}_{/X}^{\mathrm{cl}})_{/Y},$$

be a functor where  $K$  is a finite  $\infty$ -category. We must show that  $\theta$  can be extended to a functor

$$\theta^{\triangleright}: K^{\triangleright} \rightarrow (\mathrm{AnNil}_{/X}^{\mathrm{cl}})_{/Y}.$$

Thanks to Proposition 2.18 we are allowed to reduce ourselves to the case where morphisms indexed by  $K$  are square-zero extensions. The result now follows from the fact that  $Y$  being an analytic moduli problem sends finite colimits along square-zero extensions to finite limits.  $\square$

**Lemma 2.46.** *Let  $X \in \mathrm{dAn}_k$ . Given any  $Y \in \mathrm{AnFMP}_{X/}$ , then for each  $i = 0, 1$  the  $i$ -th projection morphism*

$$p_i: X \times_Y X \rightarrow X,$$

*computed in the  $\infty$ -category  $\mathrm{dAnSt}_k$  lies in the essential image of  $\mathrm{AnFMP}_{/X}$  via the canonical functor  $\mathrm{AnFMP}_{/X} \rightarrow (\mathrm{dAnSt}_k)_{/X}$ .*

*Proof.* Consider the pullback diagram

$$\begin{array}{ccc} X \times_Y X & \xrightarrow{p_1} & X \\ \downarrow p_0 & & \downarrow \\ X & \longrightarrow & Y, \end{array}$$

computed in the  $\infty$ -category  $\mathrm{dAnSt}_k$ . Thanks to Proposition 2.30 together with the fact that fiber products commute with filtered colimits in the  $\infty$ -category  $\mathrm{dAnSt}_k$ , we deduce that

$$X \times_Y X \simeq \operatorname{colim}_{Z \in \mathrm{AnNil}_{X/Y}^{\mathrm{cl}}} X \times_Z X,$$

in  $\mathrm{dAnSt}_k$ . It is clear that  $(p_i: X \times_Z X \rightarrow X)$  lies in the essential image of  $\mathrm{AnFMP}_{/X}$ , for each  $Z \in (\mathrm{AnNil}_{X/Y}^{\mathrm{cl}})_{/Y}$  and  $i = 0, 1$ . Thus also the filtered colimit

$$(p_i: X \times_Y X \rightarrow X) \in \mathrm{AnFMP}_{/X}, \quad \text{for } i = 0, 1,$$

as desired.  $\square$

Just as in the previous section we deduce that every analytic formal moduli problem over  $X$  admits the structure of an *ind-inf*-object in  $\mathrm{AnPreStk}_k$ :

**Corollary 2.47.** *Let  $Y \in (\mathrm{dAnSt}_k)_{/X}$ . Then  $Y$  is equivalent to an analytic formal moduli problem over  $X$  if and only if there exists a presentation*

$$Y \simeq \operatorname{colim}_{i \in I} Z_i,$$

*where  $I$  is a filtered  $\infty$ -category and for every  $i \rightarrow j$  in  $I$ , the induced morphism*

$$Z_i \rightarrow Z_j,$$

*is a closed embedding of derived  $k$ -affinoid spaces that are nil-isomorphic to  $X$ .*

*Proof.* It follows immediately from Proposition 2.45 (2).  $\square$

**Definition 2.48.** Let  $Y \in \mathrm{AnFMP}_{/X}$ . We define the  $\infty$ -category of *coherent modules on  $Y$* , denoted  $\mathrm{Coh}^+(Y)$ , as the limit

$$\mathrm{Coh}^+(Y) := \lim_{Z \in (\mathrm{dAn}_k)_{/Y}} \mathrm{Coh}^+(Z),$$

computed in the  $\infty$ -category  $\mathrm{Cat}_{\infty}^{\mathrm{st}}$ . We define the  $\infty$ -category of *pseudo-pro-coherent modules on  $Y$* , denoted  $\mathrm{Pro}^{\mathrm{ps}}(\mathrm{Coh}^+(Y))$ , as

$$\mathrm{Pro}^{\mathrm{ps}}(\mathrm{Coh}^+(Y)) := \lim_{Z \in (\mathrm{AnNil}_{X/Y}^{\mathrm{cl}})_{/Y}} \mathrm{Pro}(\mathrm{Coh}^+(Z)),$$

where the limit is computed in the  $\infty$ -category  $\mathrm{Cat}_{\infty}^{\mathrm{st}}$ .

**Definition 2.49.** Let  $Y \in \text{AnFMP}_{/X}$ ,  $Z \in \text{dAfd}_k$  and let  $\mathcal{F} \in \text{Coh}^+(Z)^{\geq 0}$ . Suppose furthermore that we are given a morphism  $f: Z \rightarrow Y$ . We define the *tangent space of  $Y$  at  $f$  twisted by  $\mathcal{F}$*  as the fiber

$$\mathbb{T}_{Y,Z,\mathcal{F},f}^{\text{an}} := \text{fib}_f(Y(Z[\mathcal{F}]) \rightarrow Y(Z)) \in \mathcal{S}.$$

Whenever the morphism  $f$  is clear from the context, we shall drop the subscript  $f$  above and denote the tangent space simply by  $\mathbb{T}_{Y,Z,\mathcal{F}}^{\text{an}}$ .

*Remark 2.50.* Let  $Y \in \text{AnFMP}_{/X}$ . The equivalence of ind-objects

$$Y \simeq \text{colim}_{S \in (\text{AnNil}_{/X}^{\text{cl}})_{/Y}} S,$$

in the  $\infty$ -category  $\text{dAnSt}_k$ , implies that, for any  $Z \in \text{dAfd}_k$ , one has an equivalence of mapping spaces

$$\text{Map}_{\text{dAnSt}_k}(Z, Y) \simeq \text{colim}_{S \in (\text{AnNil}_{/X}^{\text{cl}})_{/Y}} \text{Map}_{\text{AnPreStk}}(Z, S).$$

For this reason, given any morphism  $f: Z \rightarrow Y$  and any  $\mathcal{F} \in \text{Coh}^+(Z)^{\geq 0}$ , we can identify the tangent space  $\mathbb{T}_{Y,Z,\mathcal{F}}^{\text{an}}$  with the filtered colimit of spaces

$$\mathbb{T}_{Y,Z,\mathcal{F}}^{\text{an}} \simeq \text{colim}_{S \in (\text{AnNil}_{/X}^{\text{cl}})_{Z//Y}} \text{fib}_f(S(Z[\mathcal{F}]) \rightarrow S(Z)) \quad (2.9)$$

$$\simeq \text{colim}_{S \in (\text{AnNil}_{/X}^{\text{cl}})_{Z//Y}} \mathbb{T}_{S,Z,\mathcal{F}}^{\text{an}} \quad (2.10)$$

$$\simeq \text{colim}_{S \in (\text{AnNil}_{/X}^{\text{cl}})_{Z//Y}} \text{Map}_{\text{Coh}^+(Z)}(f_{S,Z}^*(\mathbb{L}_S^{\text{an}}), \mathcal{F}), \quad (2.11)$$

where  $f_{S,Z}: Z \rightarrow S$  is a transition morphism, in  $(\text{dAn}_k)_{/X}$ , factoring  $f: Z \rightarrow Y$  such that

$$(S \rightarrow X) \in \text{AnNil}_{/X}^{\text{cl}}.$$

The final equivalence in (2.9), follows from [20, Lemma 7.7]. Therefore, we deduce that the analytic formal moduli problem  $Y \in \text{AnFMP}_{/X}$  admits an *absolute pro-cotangent complex* given as

$$\mathbb{L}_Y^{\text{an}} := \{f_{S,Z}^*(\mathbb{L}_S^{\text{an}})\}_{Z,S \in (\text{AnNil}_{/X}^{\text{cl}})_{/Y}} \in \text{Pro}^{\text{ps}}(\text{Coh}^+(Y)).$$

**Corollary 2.51.** *Let  $Y \in \text{AnFMP}_{/X}$ . Then its absolute cotangent complex  $\mathbb{L}_Y^{\text{an}}$  classifies analytic deformations on  $Y$ . More precisely, given any morphism  $Z \rightarrow Y$  where  $Z \in \text{dAfd}_k$  and  $\mathcal{F} \in \text{Coh}^+(Z)^{\geq 0}$  one has a natural equivalence of mapping spaces*

$$\mathbb{T}_{Y,Z,\mathcal{F}}^{\text{an}} \simeq \text{Map}_{\text{Pro}(\text{Coh}^+(Y))}(\mathbb{L}_Y^{\text{an}}, \mathcal{F}).$$

*Proof.* It follows immediately from the natural equivalences displayed in (2.9) combined with the description of mapping spaces in  $\infty$ -categories of pro-objects.  $\square$

We now introduce the notion of square-zero extensions of analytic formal moduli problems over  $X$ :

*Construction 2.52.* Let  $(f: Y \rightarrow X) \in \text{AnFMP}_{/X}$ . Let  $d: \mathbb{L}_Y^{\text{an}} \rightarrow \mathcal{F}[1]$  be an *analytic derivation* in  $\text{Pro}(\text{Coh}^+(Y))$ , where  $\mathcal{F} \in \text{Coh}^+(Y)^{\geq 0}$ , such that

$$\mathcal{F} \simeq f^*(\mathcal{F}'),$$

for some suitable object  $\mathcal{F}' \in \mathrm{Coh}^+(X)^{\geq 0}$ . Thanks to Remark 2.50 one has the following sequence of natural equivalences of mapping spaces

$$\mathrm{Map}_{\mathrm{Pro}(\mathrm{Coh}^+(Y))}(\mathbb{L}_Y^{\mathrm{an}}, \mathcal{F}[1]) \simeq \lim_{S \in (\mathrm{AnNil}_{/X}^{\mathrm{cl}})_{/Y}} \mathrm{colim}_{S' \in (\mathrm{AnNil}_{/X}^{\mathrm{cl}})_{S//Y}} \mathrm{Map}_{\mathrm{Pro}(\mathrm{Coh}^+(S))}(f_{S,S'}^*(\mathbb{L}_{S'}^{\mathrm{an}}), g_S^*(\mathcal{F}')[1]) \quad (2.12)$$

$$\simeq \lim_{S \in (\mathrm{AnNil}_{/X}^{\mathrm{cl}})_{/Y}} \mathrm{colim}_{S' \in (\mathrm{AnNil}_{/X}^{\mathrm{cl}})_{S//Y}} \mathrm{Map}_{\mathrm{Pro}(\mathrm{Coh}^+(S))}(\mathbb{L}_{S'}^{\mathrm{an}}, (f_{S,S'})_* g_S^*(\mathcal{F}')[1]), \quad (2.13)$$

where  $g_S: S \rightarrow X$  denotes the structural morphism in  $\mathrm{AnNil}_{/X}^{\mathrm{cl}}$  and  $f_{S,S'}: S \rightarrow S'$  a given transition morphism in the  $\infty$ -category  $(\mathrm{AnNil}_{/X}^{\mathrm{cl}})_{/Y}$ . For this reason, we can form the filtered colimit

$$Y' := \mathrm{colim}_{S \in (\mathrm{AnNil}_{/X}^{\mathrm{cl}})_{/Y}} \mathrm{colim}_{S' \in (\mathrm{AnNil}_{/X}^{\mathrm{cl}})_{S//Y}} \bar{S}' \in \mathrm{dAnSt}_k,$$

where  $S' \rightarrow \bar{S}'$  denotes the square-zero extension induced from  $d$  together with (2.12). By construction, one has a natural morphism  $Y \hookrightarrow Y'$  in the  $\infty$ -category  $(\mathrm{dAnSt}_k)_{/X}$ . Moreover, thanks to Proposition 2.39 it follows that  $Y' \in \mathrm{AnFMP}_{/X}$ .

**Definition 2.53.** Let  $Y \in \mathrm{AnFMP}_{/X}$ . Suppose we are given an analytic derivation

$$d: \mathbb{L}_Y^{\mathrm{an}} \rightarrow \mathcal{F}[1],$$

in  $\mathrm{Pro}(\mathrm{Coh}^+(Y))$  where  $\mathcal{F} \in \mathrm{Coh}^+(Y)^{\geq 0}$  is such that  $\mathcal{F} \simeq f^*(\mathcal{F}')$ , for some  $\mathcal{F}' \in \mathrm{Coh}^+(X)^{\geq 0}$ . We shall say that the induced morphism

$$h: Y \rightarrow Y',$$

defined in Construction 2.52, is a *square-zero extension* of  $Y$  associated to the analytic derivation  $d$ .

**Corollary 2.54.** Let  $Y \in \mathrm{AnFMP}_{/X}$ . Let  $h: X \hookrightarrow S$  denote a square-zero extension in  $\mathrm{dAn}_k$ . Then the space of cartesian squares

$$\begin{array}{ccc} Y & \xrightarrow{h'} & Y' \\ \downarrow f & & \downarrow g \\ X & \xrightarrow{h} & S, \end{array}$$

such that  $h': Y \rightarrow Y'$  is a square-zero extension and  $g: Y' \rightarrow S$  exhibits the former as an analytic formal moduli problem over  $S$  is naturally equivalent to the space of factorizations

$$f^* \mathbb{L}_X^{\mathrm{an}} \rightarrow \mathbb{L}_Y^{\mathrm{an}} \rightarrow f^*(\mathcal{F}')[1],$$

in  $\mathrm{Pro}^{\mathrm{ps}}(\mathrm{Coh}^+(Y))$ , of the analytic derivation  $d: \mathbb{L}_X^{\mathrm{an}} \rightarrow \mathcal{F}'[1]$  associated to the morphism  $h$  above.

*Proof.* By the universal property of filtered colimits together with the fact that these preserve fiber products we reduce the statement to the case where  $Y \in \mathrm{AnNil}_{/X}$  and thus  $Y' \in \mathrm{AnNil}_{/S}$ , in which case the statement follows immediately by the universal property of the relative analytic cotangent complex.  $\square$

**Corollary 2.55.** Let  $f: Z \rightarrow X$  be a morphism in the  $\infty$ -category  $\mathrm{dAn}_k$ . Suppose we are given analytic formal moduli problems

$$f: Y \rightarrow X \quad \text{and} \quad g: \tilde{Z} \rightarrow Z$$

together with a commutative diagram

$$\begin{array}{ccc} \tilde{Z} & \xrightarrow{s} & Y \\ \downarrow & & \downarrow \\ Z & \xrightarrow{f} & X, \end{array}$$

in the  $\infty$ -category  $\mathrm{dAnSt}_k$ . Let  $d: \mathbb{L}_Z^{\mathrm{an}} \rightarrow \mathcal{F}[1]$ , where  $\mathcal{F} \in \mathrm{Coh}^+(Z)^{\geq 0}$ , be an analytic derivation corresponding to a square-zero extension morphism  $Z \rightarrow Z'$  in the  $\infty$ -category  $\mathrm{dAn}_k$ . Assume that  $d$  induces a square-zero extension  $\tilde{d}: \mathbb{L}_{\tilde{Z}}^{\mathrm{an}} \rightarrow \mathcal{F}[1]$  and let  $h: \tilde{Z} \hookrightarrow \tilde{Z}'$  be the induced square-zero extension in  $\mathrm{dAnSt}_k$  such that we have a cartesian diagram

$$\begin{array}{ccc} \tilde{Z} & \longrightarrow & \tilde{Z}' \\ \downarrow & & \downarrow \\ Z & \longrightarrow & Z' \end{array}$$

in the  $\infty$ -category  $\mathrm{dAnSt}_k$ . Then the space of factorizations

$$s: \tilde{Z} \rightarrow \tilde{Z}' \rightarrow Y,$$

is naturally equivalent to the space of factorizations

$$\tilde{d}: \mathbb{L}_{\tilde{Z}}^{\mathrm{an}} \rightarrow \mathbb{L}_{\tilde{Z}/Y}^{\mathrm{an}} \rightarrow \mathcal{F}[1],$$

in the  $\infty$ -category  $\mathrm{Pro}(\mathrm{Coh}^+(\tilde{Z}))$ .

*Proof.* The statement holds true in the case where  $\tilde{Z} \in \mathrm{AnNil}/_Z$  and  $Y \in \mathrm{AnNil}/_X$ , by the universal property of the relative cotangent complex. The general case is reduced to the previous one by a standard argument with ind-objects in  $\mathrm{dAnSt}_k$ .  $\square$

**2.5. Non-archimedean nil-descent for almost perfect complexes.** In this §, we prove that the  $\infty$ -category  $\mathrm{Coh}^+(X)$ , for  $X \in \mathrm{dAn}_k$  satisfies nil-descent with respect to morphisms  $Y \rightarrow X$ , which exhibit the former as an analytic formal moduli problem over  $X$ .

**Proposition 2.56.** *Let  $f: Y \rightarrow X$ , where  $X \in \mathrm{dAn}_k$  and  $Y \in \mathrm{AnFMP}/_X$ . Consider the Čech nerve  $Y^\bullet: \Delta^{\mathrm{op}} \rightarrow \mathrm{dAnSt}_k$  associated to  $f$ . Then the natural functor*

$$f_\bullet^*: \mathrm{Coh}^+(X) \rightarrow \lim_{\Delta} (\mathrm{Coh}^+(Y^\bullet)),$$

*is an equivalence of  $\infty$ -categories.*

*Proof.* Consider the natural equivalence of derived  $k$ -analytic stacks

$$Y \simeq \operatorname{colim}_{Z \in (\mathrm{AnNil}^{\mathrm{cl}}/_X)/_Y} Z.$$

Then, by definition one has a natural equivalence

$$\mathrm{Coh}^+(Y) \simeq \lim_{Z \in (\mathrm{AnNil}^{\mathrm{cl}}/_X)/_Y} \mathrm{Coh}^+(Z),$$

of  $\infty$ -categories. In particular, since totalizations commute with cofiltered limits in  $\mathrm{Cat}_\infty$ , it follows that we can suppose from the beginning that  $Y \simeq Z$  for some  $Z \in \mathrm{AnNil}/_X$ . In this case, the morphism  $f: Y \rightarrow X$  is affine. In particular, the fact that  $\mathrm{Coh}^+(-)$  satisfies descent along admissible open immersions, combined with Lemma 2.14 we further reduce ourselves to the case where both  $X$  and  $Y$  are derived  $k$ -affinoid spaces. In this case, by Tate acyclicity theorem it follows that letting  $A := \Gamma(X, \mathcal{O}_X^{\mathrm{alg}})$  and  $B := \Gamma(Y, \mathcal{O}_Y^{\mathrm{alg}})$ , the pullback functor  $f^*$  can be identified with the usual base change functor

$$\mathrm{Coh}^+(A) \rightarrow \mathrm{Coh}^+(B).$$

In this case, it follows that  $B$  is nil-isomorphic to  $A$ . Moreover, since the latter are noetherian derived  $k$ -algebras the statement of the proposition follows due to [13, Theorem 3.3.1].  $\square$

We now deduce *pseudo-pro-nil-descent* for morphisms of the form  $Y \rightarrow X$ , which exhibit  $Y$  as an analytic formal moduli problem over  $X$ :

**Corollary 2.57.** *Let  $X \in \mathbf{dAn}_k$  and  $f: Y \rightarrow X$  a morphism in  $\mathbf{dAnSt}_k$  which exhibits  $Y$  as an analytic formal moduli problem over  $X$ . Then the natural functor*

$$f_{\bullet}^*: \mathrm{Pro}(\mathrm{Coh}^+(X)) \rightarrow \lim_{\Delta} (\mathrm{Pro}^{\mathrm{ps}} \mathrm{Coh}^+(Y^{\bullet}/X)),$$

*is fully faithful, where  $Y^{\bullet}$  denotes the Čech nerve associated to the morphism  $f$ . Moreover, the essential image of the functor  $f_{\bullet}^*$  identifies canonically with the full subcategory*

$$\lim_{\Delta}^{\prime} \mathrm{Pro}^{\mathrm{ps}}(\mathrm{Coh}^+(X)) \subseteq \lim_{\Delta} \mathrm{Pro}^{\mathrm{ps}}(\mathrm{Coh}^+(Y^{\bullet}/X)),$$

*spanned by those  $\{\mathcal{F}_{i,[n]}\}_{i \in I^{\mathrm{op}}, [n] \in \Delta} \in \lim_{\Delta} (\mathrm{Pro}^{\mathrm{ps}}(\mathrm{Coh}^+(Y^{\bullet}/X)))$ , for some filtered  $\infty$ -category  $I$ , which belong to the essential image of the natural functor*

$$\lim_{\Delta} \mathrm{Fun}(I^{\mathrm{op}}, \mathrm{Coh}^+(Y^{\bullet}/X)) \rightarrow \lim_{\Delta} \mathrm{Pro}^{\mathrm{ps}}(\mathrm{Coh}^+(Y^{\bullet}/X)).$$

*Proof.* By the very definition of the  $\infty$ -category  $\mathrm{Pro}^{\mathrm{ps}}(\mathrm{Coh}^+(Y))$ , we reduce ourselves as in Proposition 2.56 to the case where  $Y = S$ , for some  $S \in \mathbf{AnNil}/_X$ . In this case, it follows readily from Proposition 2.56 that the natural functor

$$f_{\bullet}^*: \mathrm{Pro}(\mathrm{Coh}^+(X)) \rightarrow \lim_{\Delta} \mathrm{Pro}^{\mathrm{ps}}(\mathrm{Coh}^+(S^{\bullet}/X)),$$

is fully faithful. We now proceed to prove the second claim of the corollary. Notice that, Proposition 2.22 implies that there exists a well defined right adjoint

$$f_*: \mathrm{Coh}^+(S) \rightarrow \mathrm{Coh}^+(X),$$

to the usual pullback functor  $f^*: \mathrm{Coh}^+(X) \rightarrow \mathrm{Coh}^+(S)$ . We can extend the right adjoint  $f_*$  to a well defined functor

$$f_*: \mathrm{Pro}(\mathrm{Coh}^+(S)) \rightarrow \mathrm{Pro}(\mathrm{Coh}^+(X)),$$

which commutes with cofiltered limits. For this reason, we have a well defined functor

$$f_{\bullet,*}: \lim_{\Delta} (\mathrm{Pro}(\mathrm{Coh}^+(S^{\bullet}/X))) \rightarrow \mathrm{Pro}(\mathrm{Coh}^+(X)),$$

which further commutes with cofiltered limits. Denote by  $\mathcal{D} := \lim_{\Delta} (\mathrm{Pro}(\mathrm{Coh}^+(S^{\bullet}/X)))$ . We claim that  $f_{\bullet,*}$  is a right adjoint to  $f_{\bullet}^*$  above. Indeed, given any  $\{\mathcal{F}_i\}_{i \in I^{\mathrm{op}}} \in \mathrm{Pro}(\mathrm{Coh}^+(X))$  and  $\{\mathcal{G}_{j,[n]}\}_{j \in J_{[n]}^{\mathrm{op}}, [n] \in \Delta^{\mathrm{op}}} \in \lim_{\Delta} (\mathrm{Pro}(\mathrm{Coh}^+(S^{\bullet}/X)))$ , we compute

$$\begin{aligned} \mathrm{Map}_{\mathcal{D}}(f_{\bullet}^*(\{\mathcal{F}_i\}_{i \in I^{\mathrm{op}}}), \{\mathcal{G}_{j,[n]}\}_{j \in J_{[n]}^{\mathrm{op}}, [n] \in \Delta^{\mathrm{op}}}) &\simeq \lim_{[n] \in \Delta} \mathrm{Map}_{\mathrm{Pro}^{\mathrm{ps}}(\mathrm{Coh}^+(S^{\bullet}/X))}(\{f_{[n]}^{\bullet}(\mathcal{F}_i)\}_{i \in I^{\mathrm{op}}}, \{\mathcal{G}_{i,[n]}\}_{i \in I_{[n]}^{\mathrm{op}}}) \\ \lim_{[n] \in \Delta^{\mathrm{op}}} \lim_{j \in J_{[n]}^{\mathrm{op}}} \mathrm{colim}_{i \in I} \mathrm{Map}_{\mathrm{Coh}^+(S^{\bullet}/X)}(f_{[n]}^*(\mathcal{F}_i), \mathcal{G}_{i,[n]}) &\simeq \lim_{[n] \in \Delta} \lim_{j \in J_{[n]}^{\mathrm{op}}} \mathrm{colim}_{i \in I} \mathrm{Map}_{\mathrm{Coh}^+(X)}(\mathcal{F}_i, f_{[n],*}(\mathcal{G}_{i,[n]})) \\ \lim_{[n] \in \Delta^{\mathrm{op}}} \mathrm{Map}_{\mathrm{Pro}(\mathrm{Coh}^+(X))}(\{\mathcal{F}_i\}_{i \in I^{\mathrm{op}}}, \{f_{[n],*}(\mathcal{G}_{i,[n]})\}_{i \in I_{[n]}^{\mathrm{op}}}) &\simeq \mathrm{Map}_{\mathrm{Pro}(\mathrm{Coh}^+(X))}(\{\mathcal{F}_i\}_{i \in I^{\mathrm{op}}}, \lim_{[n] \in \Delta} \{f_{[n],*}(\mathcal{G}_{i,[n]})\}_{i \in I_{[n]}^{\mathrm{op}}}), \end{aligned}$$

as desired. It is clear that the functor  $f_{\bullet}^*$  above factors through the full subcategory

$$\lim_{\Delta}^{\prime} \mathrm{Pro}^{\mathrm{ps}}(\mathrm{Coh}^+(S^{\bullet}/X)) \subseteq \lim_{\Delta} (\mathrm{Pro}(\mathrm{Coh}^+(S^{\bullet}/X))).$$

For this reason, the pair  $(f_{\bullet}^*, f_{\bullet,*})$  restricts to a well defined adjunction

$$f_{\bullet}^*: \mathrm{Pro}(\mathrm{Coh}^+(X)) \rightleftarrows \lim_{\Delta}^{\prime} (\mathrm{Pro}(\mathrm{Coh}^+(S^{\bullet}/X))) : f_{\bullet,*}.$$

In order to conclude, we will show that the functor

$$f_{\bullet,*}: \lim'_{\Delta} (\text{Pro}(\text{Coh}^+(S^\bullet/X))) \rightarrow \text{Pro}(\text{Coh}^+(X)),$$

is conservative. Since both the  $\infty$ -categories  $\text{Pro}(\text{Coh}^+(X))$  and  $\lim'_{\Delta} (\text{Pro}^{\text{ps}}(\text{Coh}^+(YS^\bullet/X)))$  are stable, we are reduced to prove that given any

$$\{\mathcal{G}_{i,[n]}\}_{i \in I^{\text{op}}} \in \lim'_{\Delta} (\text{Pro}^{\text{ps}}(\text{Coh}^+(S^\bullet/X))),$$

such that

$$\lim_{[n] \in \Delta} f_{\bullet,*}(\{\mathcal{G}_{i,[n]}\}_{i \in I^{\text{op}}}) \simeq 0, \quad (2.14)$$

we necessarily have

$$\{\mathcal{G}_{i,[n]}\}_{i \in I^{\text{op}}} \simeq 0,$$

in  $\lim'_{\Delta} (\text{Pro}^{\text{ps}}(\text{Coh}^+(S^\bullet/X)))$ . Assume then (2.14). Under our hypothesis, for each index  $i \in I$ , the object  $\{\mathcal{G}_{i,[n]}\}_{[n] \in \Delta}$  satisfies descent datum and thanks to Proposition 2.56 it produces a uniquely well defined object

$$\mathcal{G}_i \in \text{Pro}(\text{Coh}^+(X)),$$

such that for every  $[n] \in \Delta$ , one has a natural equivalence of the form

$$\begin{aligned} f_{[n]}^*(\mathcal{G}_i) &\simeq \mathcal{G}_{i,[n]} \\ &\in \text{Coh}^+(S^{[n]}). \end{aligned}$$

We deduce then that

$$\begin{aligned} f_{\bullet}^*(\{\mathcal{G}_i\}_{i \in I^{\text{op}}}) &\simeq \{\mathcal{G}_{i,[n]}\}_{i \in I^{\text{op}}, [n]} \\ &\simeq 0, \end{aligned}$$

in  $\lim'_{\Delta} \text{Pro}^{\text{ps}}(\text{Coh}^+(S^\bullet/X))$ , as desired.  $\square$

We now use the pseudo-pro-nil-descent for  $\text{Pro}(\text{Coh}^+(X))$  to compute relative analytic cotangent complexes of analytic formal moduli problems over  $X$ :

**Corollary 2.58.** *Let  $f: Z \rightarrow X$  be a morphism in  $\text{dAn}_k$ . Suppose we are given a pullback square*

$$\begin{array}{ccc} \tilde{Z} & \xrightarrow{h} & Y \\ \downarrow & & \downarrow \\ Z & \longrightarrow & X, \end{array}$$

in the  $\infty$ -category  $\text{dAnSt}_k$ , where  $(Y \rightarrow X) \in \text{AnFMP}/_X$  and  $(g: \tilde{Z} \rightarrow Z) \in \text{AnFMP}/_Z$ . Then the lax-object

$$\{\mathbb{L}_{\tilde{Z}^{[n]}/Y^{[n]}}^{\text{an}}\} \in \lim_{\text{lax}, \Delta} (\text{Pro}^{\text{ps}}(\text{Coh}^+(\tilde{Z}^\bullet/Z))),$$

defines a cartesian section

$$\{\mathbb{L}_{\tilde{Z}^{[n]}/Y^{[n]}}^{\text{an}}\} \in \lim_{\Delta} \text{Pro}(\text{Coh}^+((\tilde{Z})^\bullet/Z)),$$

which belongs to the essential image of the natural functor

$$g_{\bullet}^*: \text{Pro}(\text{Coh}^+(Z)) \rightarrow \lim_{\Delta} \text{Pro}(\text{Coh}^+(\tilde{Z}^\bullet/Z)).$$

*Proof.* We first show that the object

$$\{\mathbb{L}_{(\tilde{Z})^{[n]}/Y^{[n]}}^{\text{an}}\} \in \lim_{\text{lax}, \Delta} \text{Pro}^{\text{ps}}(\text{Coh}^+((\tilde{Z})^\bullet/Z)),$$

defines a cartesian section in

$$\lim_{\Delta} \text{Pro}(\text{Coh}^+((\tilde{Z})^\bullet/Z)).$$

In order to show this assertion, it is sufficient to prove for every  $[n] \in \Delta$ , that we have a natural equivalence

$$p_{i,n,n+1}^*(\mathbb{L}_{\tilde{Z}^{[n]}/Y^{[n]}}^{\text{an}}) \simeq \mathbb{L}_{\tilde{Z}^{[n+1]}/Y^{[n+1]}}^{\text{an}},$$

in the  $\infty$ -category  $\text{Pro}^{\text{ps}}(\text{Coh}^+((\tilde{Z})^{[n+1]}))$ , for each projection morphism

$$p_{i,n,n+1}: \tilde{Z}^{[n+1]} \rightarrow \tilde{Z}^{[n]},$$

in the Čech nerve associated to the morphism  $g$ . The latter claim is an immediate consequence of the base change property for the relative analytic cotangent complex whenever  $Y \in \text{AnNil}/_X$  (and thus so do  $\tilde{Z} \in \text{AnNil}/_Z$ ), c.f. [20, Proposition 5.12]. In the general case where  $Y \in \text{AnFMP}/_X$ , we reduce to the previous case by combining Proposition 2.45 with the observation that filtered colimits commute with finite limits in the  $\infty$ -category  $\text{dAnSt}_k$ .

We now prove the second assertion of the Corollary: thanks to the characterization of the essential image of natural functor

$$g_\bullet^*: \text{Pro}(\text{Coh}^+(Z)) \rightarrow \lim_{\Delta} \text{Pro}^{\text{ps}}(\text{Coh}^+((\tilde{Z})^\bullet/Z)),$$

provided in Corollary 2.57, we are reduced to show that for each  $[n] \in \Delta$ , we have a natural equivalence of pro-objects

$$\mathbb{L}_{\tilde{Z}^{[n]}/Y^{[n]}}^{\text{an}} \simeq \{\mathbb{L}_{\tilde{S}^{[n]}/S^{[n]}}^{\text{an}}\}_{\tilde{S} \in (\text{AnNil}/_Z), \tilde{Z}, S \in (\text{AnNil}/_X)/_Y},$$

where  $\tilde{S} := S \times_X Z$ , for each  $S \in (\text{AnNil}_{/X}^{\text{cl}})/_Y$ . The latter statement follows readily from the first part of the proof combined with a standard inductive argument.  $\square$

**2.6. Non-archimedean formal groupoids.** Let  $X \in \text{dAn}_k$ . We start with the definition of the notion of *analytic formal groupoids over  $X$* :

**Definition 2.59.** We denote by  $\text{AnFGrpd}(X)$  the full subcategory of the  $\infty$ -category of simplicial objects

$$\text{Fun}(\Delta^{\text{op}}, \text{AnFMP}/_X),$$

spanned by those objects  $F: \Delta^{\text{op}} \rightarrow \text{AnFMP}/_X$  satisfying the following requirements:

- (1)  $F([0]) \simeq X$  ;
- (2) For each  $n \geq 1$ , the morphism

$$F([n]) \rightarrow F([1]) \times_{F([0])} \cdots \times_{F([0])} F([1]),$$

induced by the morphisms  $s^i: [1] \rightarrow [n]$  given by  $(0, 1) \mapsto (i, i+1)$ , is an equivalence in  $\text{AnFMP}/_X$ .

We shall refer to objects in  $\text{AnFGrpd}(X)$  as *analytic formal groupoids over  $X$* .

*Remark 2.60.* Note that Proposition 2.45 implies that fiber products exist in  $\text{AnFMP}/_X$ . Therefore, the previous definition is reasonable.

*Construction 2.61.* Thanks to Lemma 2.46, there exists a well defined functor  $\Phi: \text{AnFMP}_{X/} \rightarrow \text{AnFGrpd}(X)$  given by the formula

$$(X \xrightarrow{f} Y) \in \text{AnFMP}_{X/} \mapsto Y_X^\wedge \in \text{AnFGrpd}(X),$$

where we shall denote by  $Y_X^\wedge \in \text{AnFGrpd}(X)$  the Čech nerve of the morphism  $f$  computed in  $\text{AnFMP}_{X/}$ . The latter defines a formal groupoid over  $X$  admitting

$$\dots \rightrightarrows X \times_Y X \times_Y X \rightrightarrows X \times_Y X \rightrightarrows X,$$

as simplicial presentation. We shall denote the later simplicial object simply by  $X^{\times_Y \bullet} \in \text{AnFGrpd}(X)$ .

*Remark 2.62.* Let  $(X \rightarrow Y) \in \text{AnFMP}_{X/}$  and consider the corresponding analytic formal groupoid  $Y_X^\wedge \in \text{AnFMP}(X)$ . The diagonal morphism

$$\Delta: X \rightarrow X \times_Y X,$$

in  $\text{AnFMP}_{X/}$  induces a well defined morphism

$$X \rightarrow X^{\times_Y \bullet},$$

in  $\text{Fun}(\Delta^{\text{op}}, \text{AnFMP}_{X/})$ , where  $X^{\times_Y \bullet}$  denotes the Čech nerve of the morphism  $X \rightarrow Y$  computed in the  $\infty$ -category  $\text{AnFMP}_{X/}$ .

*Construction 2.63.* Let  $\mathcal{G} \in \text{AnFGrpd}(X)$ . Consider the *classifying derived  $k$ -analytic stack*,  $B_X(\mathcal{G})^{\text{pre}} \in \text{dAnSt}_k$ , obtained as the geometric realization of the simplicial object  $\mathcal{G}$ , regarded naturally as a functor

$$\mathcal{G}: \Delta^{\text{op}} \rightarrow \text{dAnSt}_k,$$

via the natural composite  $\text{AnFMP}_{X/} \rightarrow (\text{dAnSt}_k)_{/X} \rightarrow \text{dAnSt}_k$ . Given any  $Z \in \text{dAfd}_k$ , the *space of  $Z$ -points of  $B_X(\mathcal{G})^{\text{pre}}$* ,

$$B_X(\mathcal{G})^{\text{pre}}(Z),$$

can be identified with the space whose objects correspond to the datum of:

- (1) A morphism  $\tilde{Z} \rightarrow X$ , where  $\tilde{Z} \in \text{dAnSt}_k$ , such that

$$\tilde{Z} \simeq Z \times_{B_X(\mathcal{G})^{\text{pre}}} X;$$

- (2) A morphism of groupoid-objects

$$\tilde{Z} \times_Z \tilde{Z} \rightarrow \mathcal{G},$$

in the  $\infty$ -category  $\text{dAnSt}_k$ .

We now define  $B_X(\mathcal{G}) \rightarrow B_X^{\text{pre}}(\mathcal{G})$  as the sub-object spanned by those connected components of  $B_X(\mathcal{G})^{\text{pre}}$  corresponding to morphisms  $\tilde{Z} \rightarrow Z$  in Construction 2.63 (1) which exhibit  $\tilde{Z} \in \text{AnFMP}_{Z/}$ . Denote by

$$\text{can}: B_X(\mathcal{G}) \rightarrow B_X(\mathcal{G})^{\text{pre}},$$

the canonical morphism. It follows from the construction that the natural morphism

$$X \rightarrow B_X(\mathcal{G})^{\text{pre}},$$

factors as  $X \rightarrow B_X(\mathcal{G}) \xrightarrow{\text{can}} B_X(\mathcal{G})^{\text{pre}}$ .

We are able to prove that the object  $B_X(\mathcal{G})$  admits a deformation theory:

**Lemma 2.64.** *The natural morphism  $X \rightarrow B_X(\mathcal{G})$  exhibits the latter as an object in the  $\infty$ -category  $\text{AnFMP}_{X/}$  of analytic formal moduli problems under  $X$ .*

*Proof.* Thanks to Proposition 2.39 it suffices to prove that  $B_X(\mathcal{G})$  is infinitesimally cartesian and it admits furthermore a pro-cotangent complex. The fact that  $B_X(\mathcal{G})$  is infinitesimally cartesian follows from the modular description of  $B_X(\mathcal{G})$  combined with the fact that  $\mathcal{G}$  is infinitesimally cartesian, as well. Similarly,  $B_X(\mathcal{G})$  being nilcomplete follows again from its modular description combined with the fact that analytic formal moduli problems are nilcomplete.

We are thus required to show that  $B_X(\mathcal{G})$  admits a *global* pro-cotangent complex. Let  $Z \in \mathrm{dAn}_k$  and suppose we are given an arbitrary morphism

$$q: Z \rightarrow B_X(\mathcal{G}),$$

in the  $\infty$ -category  $\mathrm{dAnSt}_k$ . Thanks to Corollary 2.57 combined with Corollary 2.58 it follows that the object

$$\{\mathbb{L}_{\tilde{Z}^{[n]}/\mathcal{G}^{[n]}}^{\mathrm{an}}\}_{[n] \in \Delta} \in \lim_{\Delta} \mathrm{Pro}^{\mathrm{ps}}(\mathrm{Coh}^+(\tilde{Z}^\bullet/Z)),$$

defines a well defined object  $(\mathbb{L}_{Z/B_X(\mathcal{G})}^{\mathrm{an}})' \in \mathrm{Pro}(\mathrm{Coh}^+(Z))$ . Moreover, it is clear that there exists a natural morphism

$$\theta: \mathbb{L}_Z^{\mathrm{an}} \rightarrow (\mathbb{L}_{Z/B_X(\mathcal{G})}^{\mathrm{an}})',$$

in the  $\infty$ -category  $\mathrm{Pro}(\mathrm{Coh}^+(Z))$ , as this holds in each level of the totalization. Let

$$q^*(\mathbb{L}_{B_X(\mathcal{G})}^{\mathrm{an}})' := \mathrm{fib}(\theta),$$

computed in the  $\infty$ -category  $\mathrm{Pro}(\mathrm{Coh}^+(Z))$ . We claim that  $q^*(\mathbb{L}_{B_X(\mathcal{G})}^{\mathrm{an}})'$  identifies with the analytic cotangent complex of  $B_X(\mathcal{G})$  at the point  $q: Z \rightarrow B_X(\mathcal{G})$ . Let

$$Z \hookrightarrow Z',$$

denote a square-zero extension which corresponds to a certain analytic derivation

$$d: \mathbb{L}_Z^{\mathrm{an}} \rightarrow \mathcal{F}[1],$$

for some  $\mathcal{F} \in \mathrm{Coh}^+(Z)^{\geq 0}$ . Using Corollary 2.54 we deduce that the space of cartesian squares of the form

$$\begin{array}{ccc} \tilde{Z} & \longrightarrow & \tilde{Z}' \\ \downarrow & & \downarrow \\ Z & \longrightarrow & Z' \end{array}$$

where the morphism  $\tilde{Z} \rightarrow \tilde{Z}'$  is a square-zero extension in the  $\infty$ -category  $\mathrm{dAnSt}_k$  is equivalent to the space of factorizations

$$d: g^* \mathbb{L}_Z^{\mathrm{an}} \rightarrow \mathbb{L}_{\tilde{Z}}^{\mathrm{an}} \xrightarrow{d'} g^*(\mathcal{F})[1],$$

in the  $\infty$ -category  $\mathrm{Pro}(\mathrm{Coh}^+(\tilde{Z}))$ . Apply the same reasoning to the each object in the Čech nerve

$$\tilde{Z}^\bullet \rightarrow Z.$$

Furthermore, Corollary 2.55 implies that the space of factorizations

$$\tilde{Z}^\bullet \rightarrow (\tilde{Z}')^\bullet \rightarrow \mathcal{G}^\bullet,$$

identifies with the space of factorizations

$$d': \mathbb{L}_{\tilde{Z}^\bullet}^{\mathrm{an}} \rightarrow \mathbb{L}_{\tilde{Z}^\bullet/\mathcal{G}}^{\mathrm{an}} \rightarrow g^*(\mathcal{F})[1],$$

in the  $\infty$ -category  $\mathrm{Pro}(\mathrm{Coh}^+(\tilde{Z}))$ . Corollary 2.58 implies that the above factorization space can be identified with the space of factorizations

$$d: \mathbb{L}_Z^{\mathrm{an}} \rightarrow (\mathbb{L}_{Z/B_X(\mathcal{G})}^{\mathrm{an}})' \rightarrow \mathcal{F}[1].$$

This implies that  $(\mathbb{L}_{Z/B_X(\mathcal{G})}^{\text{an}})'$  satisfies the universal property of the relative analytic pro-cotangent complex associated to  $X \rightarrow B_X(\mathcal{G})$ , as desired.  $\square$

**Theorem 2.65.** *The functor  $\Phi: \text{AnFMP}_{/X} \rightarrow \text{AnFGrpd}(X)$  of Construction 2.61 is an equivalence of  $\infty$ -categories.*

*Proof.* Let  $\mathcal{G} \in \text{AnFGrpd}(X)$ . Thanks to Lemma 2.64, we have a well defined functor

$$B_X(-): \text{AnFGrpd}(X) \rightarrow \text{AnFMP}_{X/},$$

given on objects by the association  $\mathcal{G} \in \text{AnFGrpd}(X) \mapsto B_X(\mathcal{G}) \in \text{AnFMP}_{X/}$ . Thanks to (1) in Construction 2.63 it follows that one has a canonical equivalence

$$X \times_{B_X(\mathcal{G})} X \simeq \mathcal{G},$$

in  $\text{dAnSt}_k$ . This shows that the construction

$$B_X(\mathcal{G}): \text{AnFGrpd}(X) \rightarrow \text{AnFMP}_{X/},$$

is a right inverse to  $\Phi$ . As a consequence the functor  $\Phi$  is essentially surjective. Thanks to Proposition 2.36 we are reduced to show that the canonical morphism

$$Y \rightarrow B_X(X \times_Y X),$$

induces an equivalence on the associated relative analytic cotangent complexes. The claim is an immediate consequence of the description of  $\mathbb{L}_{X/B_X(X \times_Y X)}^{\text{an}}$  provided in Lemma 2.64 together with Corollary 2.58.  $\square$

*Remark 2.66.* It follows from Theorem 2.65 that given  $(X \rightarrow Y) \in \text{AnFMP}_{X/}$ , we can identify the latter with the geometric realization of the associated Čech nerve, the latter regarded as a simplicial object in  $\text{AnFMP}_{X/}$  via the diagonal morphisms.

**2.7. The affinoid case.** Let  $X \in \text{dAfd}_k$  denote a derived  $k$ -affinoid space. Thanks to derived Tate acyclicity theorem, cf. [21, Theorem 3.1] the *global sections functor*

$$\Gamma: \text{Coh}^+(X) \rightarrow \text{Coh}^+(A),$$

where  $A := \Gamma(X, \mathcal{O}_X^{\text{alg}}) \in \text{CAlg}_k$ , is an equivalence of  $\infty$ -categories. Since ordinary  $k$ -affinoid algebras are Noetherian, we deduce that  $A \in \text{CAlg}_k$  is a Noetherian derived  $k$ -algebra.

**Notation 2.67.** Let  $X \in \text{dAfd}_k$  and  $A := \Gamma(X, \mathcal{O}_X)$ . We denote by

$$\text{FMP}_{/\text{Spec } A} \in \text{Cat}_{\infty},$$

the  $\infty$ -category of *algebraic formal moduli problems over Spec A*, (c.f. [23, Definition 6.11]).

**Theorem 2.68.** ([23, Theorem 6.12]) *Let  $X \in \text{dAfd}_k$  and  $A := \Gamma(X, \mathcal{O}_X^{\text{alg}}) \in \text{CAlg}_k$ . Then the induced functor*

$$(-)^{\text{an}}: \text{FMP}_{/\text{Spec } A} \rightarrow \text{AnFMP}_{X/},$$

*is an equivalence of  $\infty$ -categories.*

As an immediate consequence, we obtain the following result:

**Corollary 2.69.** *Let  $X \in \text{dAfd}_k$  and  $A := \Gamma(X, \mathcal{O}_X^{\text{alg}})$ . Then one has an equivalence of  $\infty$ -categories*

$$\text{FMP}_{\text{Spec } A // \text{Spec } A} \rightarrow \text{AnFMP}_{X//X},$$

*of pointed algebraic formal moduli problems over Spec A and pointed analytic formal moduli problems over X, respectively.*

*Proof.* It is an immediate consequence of Theorem 2.68. Indeed, equivalences of  $\infty$ -categories with final objects induce natural equivalences on the associated  $\infty$ -categories of pointed objects.  $\square$

**Lemma 2.70.** *Consider the natural functor*

$$F: \text{AnFGrpd}(X) \rightarrow \text{AnFMP}_{X//X},$$

*given on objects by the formula  $\mathcal{G} \in \text{AnFGrpd}(X) \mapsto \mathcal{G}([1]) \in \text{Ptd}(\text{AnFMP}_{/X})$ . Then  $F$  is conservative and commutes with sifted colimits.*

*Proof.* The proof of [11, Corollary 5.2.2.4] applies in our setting to show that the functor  $F: \text{AnFGrpd}(X) \rightarrow \text{Ptd}(\text{AnFMP}_{/X})$  commutes with sifted colimits. We are reduced to prove that  $F$  is also conservative. Let  $f: \mathcal{G} \rightarrow \mathcal{G}'$  be a morphism in  $\text{AnFGrpd}(X)$ . The equivalence of  $\infty$ -categories

$$\text{B}_X(\bullet): \text{AnFGrpd}(X) \rightarrow \text{AnFMP}_{X/},$$

of Theorem 2.65 implies that the morphism  $f$  can be obtained as the Čech nerve of a morphism

$$\tilde{f}: \text{B}_X(\mathcal{G}) \rightarrow \text{B}_X(\mathcal{G}'),$$

in  $\text{AnFMP}_{X/}$ . For this reason, for every  $[n] \in \mathbf{\Delta}$ , the morphism

$$f_{[n]}: \mathcal{G}([n]) \rightarrow \mathcal{G}'([n]),$$

is obtained as (an iterated) pullback of

$$f_{[1]}: \mathcal{G}([1]) \rightarrow \mathcal{G}'([1]).$$

Therefore, under the assumption that  $F(F) \simeq f_{[1]}$  is an equivalence in  $\text{AnFMP}_{X//X}$  we deduce that  $f$  itself must be an equivalence of analytic formal groupoids, as it is each of its components.  $\square$

*Remark 2.71.* Let  $(X \xrightarrow{f} Y) \in \text{AnFMP}_{X/}$ . Consider the diagram

$$\begin{array}{ccc} X & \xrightarrow{\Delta} & X \times_Y X \\ & \searrow & \downarrow p_1 \downarrow p_0 \\ & = & X \end{array}$$

in the  $\infty$ -category  $\text{dAnSt}_k$ , where  $\Delta: X \rightarrow X \times_Y X$  denotes the usual *diagonal embedding*. We then obtain a natural fiber sequence associated to the above diagram of the form

$$\Delta^* \mathbb{L}_{X \times_Y X/X}^{\text{an}} \rightarrow \mathbb{L}_{X/X}^{\text{an}} \rightarrow \mathbb{L}_{X/X \times_Y X}^{\text{an}}. \quad (2.15)$$

Notice further that by [20, Proposition 5.12] one has an equivalence

$$\mathbb{L}_{X \times_Y X/X}^{\text{an}} \simeq p_i^* \mathbb{L}_{X/Y}^{\text{an}},$$

for  $i = 0, 1$ . We further deduce that

$$\Delta^* \mathbb{L}_{X \times_Y X/X}^{\text{an}} \simeq \mathbb{L}_{X/Y}^{\text{an}},$$

in the  $\infty$ -category  $\text{Pro}(\text{Coh}^+(X))$ . Moreover, since  $\mathbb{L}_{X/X}^{\text{an}} \simeq 0$ , we obtain from the fiber sequence (2.15) a natural equivalence

$$\mathbb{L}_{X/X \times_Y X}^{\text{an}} \simeq \mathbb{L}_{X/Y}^{\text{an}}[1],$$

in  $\text{Pro}(\text{Coh}^+(X))$ . Moreover, we can identify the  $\mathbb{L}_{X \times_Y X/X}^{\text{an}}$  with the pro-object

$$\mathbb{L}_{X/X \times_Y X}^{\text{an}} \simeq \{\mathbb{L}_{X/X \times_S X}^{\text{an}}\}_{S \in \text{AnNil}_{X//Y}^{\text{cl}}},$$

where  $\mathbb{L}_{X/X \times_S X}^{\text{an}} \in \text{Coh}^+(X)$  denotes the relative analytic cotangent complex associated to the closed embedding

$$X \rightarrow X \times_S X,$$

for  $S \in \text{AnNil}_{X/Y}^{\text{cl}}$ . Thanks to [20, Corollary 5.33] we deduce that

$$\mathbb{L}_{X/X \times_S X}^{\text{an}} \simeq \mathbb{L}_{A/A \otimes_{B_S} A},$$

in  $\text{Coh}^+(A)$ , where  $B_S = \Gamma(S, \mathcal{O}_S^{\text{alg}})$ , where we have a natural identification

$$A \widehat{\otimes}_{B_S} A \simeq A \otimes_{B_S} A,$$

since the morphism  $A \rightarrow B_S$  is finite.

**Lemma 2.72.** *Let  $X \in \text{dAfd}_k$  be a derived  $k$ -affinoid space. Then the derived  $k$ -algebra of global sections*

$$A := \Gamma(X, \mathcal{O}_X^{\text{alg}}),$$

*admits a dualizing module (see [17, Definition 4.2.5] for the definition of the latter notion).*

*Proof.* This is an immediate consequence of the following facts:

- (1) Every regular  $k$ -algebra  $R$  admits a dualizing module, c.f. [25, Tag 0AWX];
- (2) Every quotient of an algebra  $R$  which admits a dualizing module admits itself a dualizing module, c.f. [25, Tag 0A7I].
- (3) The ordinary affinoid  $k$ -algebra  $\pi_0(A)$  can be realized as a quotient of a Tate algebra on  $n$ -generators,  $k\langle T_1, \dots, T_n \rangle$ . The latter being regular, we deduce from the previous items that  $\pi_0(A)$  itself admits a dualizing module (cf. [25, Tag 0AWX]).
- (4) Thanks to [17, Theorem 4.3.5] it follows that  $A$  itself admits a dualizing module.

The proof is thus concluded.  $\square$

**Lemma 2.73.** *Let  $X \in \text{dAfd}_k$  be a bounded derived  $k$ -affinoid space and let  $\omega_A \in \text{Mod}_A$  denote a dualizing module for  $A := \Gamma(X, \mathcal{O}_X^{\text{alg}})$ . Then  $\omega_A \in \text{Coh}^b(A)$ , where the latter denotes the full subcategory of (bounded) coherent  $A$ -modules.*

*Proof.* By definition it follows that for every  $i \in \mathbb{Z}$ ,  $\pi_i(\omega_A)$  is finitely generated as a discrete  $\pi_0(A)$ -module. We are thus reduced to show that  $\omega_A$  is bounded. Thanks to [17, Theorem 4.2.7] it follows that

$$\omega_A \simeq \underline{\text{Map}}_{\text{Mod}_A}(A, \omega_A),$$

is truncated. Moreover, by definition it follows that  $\omega_A \in \text{Mod}_A$  is of finite injective dimension. In particular, for every  $j \geq 0$ , we have that

$$\underline{\text{Map}}_{\text{Mod}_A}(\pi_j(A), \omega_A),$$

is bounded. Under our assumption that  $X \in \text{dAfd}_k$  is bounded it follows that  $A$  itself is a bounded derived  $k$ -algebra and therefore by a standard argument on Postnikov towers, we deduce that

$$\underline{\text{Map}}_{\text{Mod}_A}(A, \omega_A) \simeq \omega_A,$$

is bounded as well.  $\square$

*Remark 2.74.* Let  $X \in \text{dAfd}_k$  be a derived  $k$ -affinoid algebra. If  $X$  is not bounded then neither it is  $A \in \text{CAlg}_k$ . For this reason, a dualizing module  $\omega_A \in \text{Mod}_A$  is not in general bounded. Nonetheless, the latter is always truncated. Let  $m \in \mathbb{Z}$  be such that  $\omega_A \in \text{Mod}_A$  is  $m$ -truncated. Thanks to the proof of [17, Theorem 4.3.5], we deduce that we have a natural equivalence

$$\omega_A \simeq \text{colim}_{n \geq 0} \omega_{\tau_{\leq n}(A)},$$

in the  $\infty$ -category  $\text{Mod}_A$ , where for each  $n \geq 0$ ,  $\omega_{\tau_{\leq n}(A)} \in \text{Mod}_{\tau_{\leq n}(A)}$  is a suitable  $m$ -truncated dualizing module for the  $n$ -th truncation  $\tau_{\leq n}(A)$ .

**Definition 2.75.** Let  $X \in \mathrm{dAfd}_k$  we define its  $\infty$ -category of *ind-coherent sheaves* as

$$\mathrm{IndCoh}(X) := \mathrm{Ind}(\mathrm{Coh}^b(A)).$$

**Definition 2.76.** Let  $X \in \mathrm{dAfd}_k$  be a derived  $k$ -affinoid space. Whenever  $X$  is bounded we shall denote  $\omega_X \in \mathrm{IndCoh}(X)$  the image of a fixed dualizing module for  $A := \Gamma(X, \mathcal{O}_X^{\mathrm{alg}})$  under the natural inclusion

$$\mathrm{Coh}^b(X) \subseteq \mathrm{IndCoh}(X).$$

In the unbounded case, we shall define

$$\omega_X := \mathrm{colim}_{n \geq 0} \omega_{t_{\leq n}(X)} \in \mathrm{IndCoh}(X),$$

where the  $\{\omega_{t_{\leq n}(X)}\}_{n \geq 0}$  denotes a compatible sequence of dualizing modules for the consecutive truncations of  $X$ .

**Notation 2.77.** Let  $X \in \mathrm{dAfd}_k$  be a derived  $k$ -affinoid space together with a dualizing module  $\omega_X \in \mathrm{IndCoh}(X)$ . We shall denote by

$$\mathbf{D}_X^{\mathrm{Serre}} : \mathrm{Ind}(\mathrm{Coh}^b(X)^{\mathrm{op}}) \rightarrow \mathrm{IndCoh}(X),$$

the associated *Serre duality functor*, see [3, §2.4].

*Remark 2.78.* Let  $(X \rightarrow Y) \in \mathrm{AnFMP}_{X/}$ . The pro-cotangent complex  $\mathbb{L}_{X/Y}^{\mathrm{an}} \in \mathrm{Pro}(\mathrm{Coh}^+(X))$  can be naturally regarded as an object in the full subcategory  $\mathrm{Pro}(\mathrm{Coh}^b(X))$  of pro-objects of bounded almost perfect  $\mathcal{O}_X$ -modules, c.f. [3, Lemma 4.6].

Notice that we have an equivalence of  $\infty$ -categories  $\mathrm{Pro}(\mathrm{Coh}^b(X))^{\mathrm{op}} \simeq \mathrm{Ind}(\mathrm{Coh}^b(X)^{\mathrm{op}})$ . We now introduce the central notion of the *Serre tangent complex*:

**Definition 2.79** (Serre Tangent complex). Let  $Y \in \mathrm{AnFMP}_{X/}$ . We define the *relative analytic Serre tangent complex* of  $X \rightarrow Y$  as the object

$$\begin{aligned} \mathbb{T}_{X/Y}^{\mathrm{an}} &:= \mathbf{D}_X^{\mathrm{Serre}}(\mathbb{L}_{X/Y}^{\mathrm{an}}) \\ &\simeq \mathrm{colim}_{S \in \mathrm{AnNil}_{X//Y}^{\mathrm{cl}}} \mathbf{D}_X^{\mathrm{Serre}}(\mathbb{L}_{X/S}^{\mathrm{an}}), \end{aligned}$$

in  $\mathrm{IndCoh}(X)$ .

*Remark 2.80.* The previous definition depends on the choice of a dualizing module for  $X$ . Nonetheless, given two different choices, these differ only by an invertible  $A$ -module, c.f. [3, Proposition 2.4].

The following result will play a major role in the study of the deformation to the normal bundle:

**Proposition 2.81.** The functor  $\mathbb{T}_{X/\bullet}^{\mathrm{an}} : \mathrm{AnFMP}_{X/} \rightarrow \mathrm{QCoh}(X)$  given on objects by the formula

$$(X \rightarrow Y) \in \mathrm{AnFMP}_{X/} \mapsto \mathbb{T}_{X/Y}^{\mathrm{an}} \in \mathrm{IndCoh}(X),$$

is conservative and commutes with sifted colimits.

*Proof.* Observe that Lemma 2.70 combined with (2.15) imply that it suffices to prove that the right vertical functor in the diagram

$$\begin{array}{ccc} \mathrm{FMP}_{\mathrm{Spec} A // \mathrm{Spec} A} & \xrightarrow{(-)_{X/\bullet}^{\mathrm{an}}} & \mathrm{AnFMP}_{X//X} \\ \downarrow \mathbb{T}_{\mathrm{Spec} A/\bullet} & & \downarrow \mathbb{T}_{X/\bullet}^{\mathrm{an}} \\ \mathrm{IndCoh}(A) & \xrightarrow{(-)^{\mathrm{an}}} & \mathrm{IndCoh}(X), \end{array} \quad (2.16)$$

commutes with sifted colimits and is further conservative. The diagram is commutative as a consequence of [23, Lemma 6.9 (2)] combined with the definition of Serre duality in  $\mathrm{IndCoh}(X)$ . Moreover, [3, Corollary 4.31] implies that

$$\mathbb{T}_{\mathrm{Spec} A/\bullet} : \mathrm{FMP}_{\mathrm{Spec} A/\mathrm{Spec} A} \rightarrow \mathrm{IndCoh}(A),$$

is both conservative and commutes with sifted colimits. Furthermore, the bottom horizontal functor in (2.16) is an equivalence of  $\infty$ -categories, see for instance [23, Theorem 4.5]. Thanks to Corollary 2.69, we further deduce that the upper horizontal functor in (2.16) is an equivalence, and the result follows.  $\square$

### 3. NON-ARCHIMEDEAN DEFORMATION TO THE NORMAL BUNDLE

In this §, we introduce the construction of the deformation to the normal cone in the setting of derived  $k$ -analytic geometry. The construction has already been studied in [23], in the particular case of the natural morphism  $t_0(X) \rightarrow X$ , for a general  $X \in \mathrm{dAn}_k$ . On the other hand, the situation in the algebraic case was extensively studied in [11].

**3.1. General overview.** Our main goal in this text can be summarized as follows: given a morphism  $f: X \rightarrow Y$  in the  $\infty$ -category  $\mathrm{dAnSt}_k$ , admitting a (relative) deformation theory, we wish to construct a family over the  $k$ -analytic affine linespread

$$\mathcal{D}_{X/Y}^{\mathrm{an}} \rightarrow \mathbf{A}_k^1,$$

which can be thought as a (natural) deformation of the formal completion of the morphism  $Y_X^\wedge$  to the corresponding shifted tangent bundle  $\mathbf{T}_{X/Y}^{\mathrm{an}}[1]$ . Moreover, we wish to canonically *spread out* the Hodge filtration on  $\mathbf{T}_{X/Y}^{\mathrm{an}}[1]$  over  $\mathbf{A}_k^1$ , or in other words to extend the Hodge filtration over the formal completion  $Y_X^\wedge$ .

Our construction has two main properties, namely: it satisfies étale descent (by construction) and it is induced from the algebraic theory, via the relative analytification functor introduced in [15].

As a general remark, we will be typically interested in the case where the morphism  $f: X \rightarrow Y$  is a morphism between geometric derived  $k$ -analytic stacks. The reader can safely assume that  $f$  is simply a morphism of (derived)  $k$ -analytic spaces. Nonetheless, the fact that our construction works in the general case of a morphism admitting relative deformation theory is useful in practice as we shall now explain: given a morphism  $f: X \rightarrow Y$  admitting deformation theory, say a morphism between geometric derived  $k$ -analytic stacks, we can replace, without loss of generality,  $f$  with the inclusion of  $X$  in the formal completion

$$i: X \rightarrow Y_X^\wedge,$$

the latter being an (ind)-closed immersion, see Proposition 2.30. This observation is useful in order to make the construction less obscure in technical terms. The underlying justification of this principle is the following: the morphism  $q: Y_X^\wedge \rightarrow Y$  is formally étale in the sense that the natural morphism

$$\mathbb{L}_{X/Y} \simeq \mathbb{L}_{X/Y_X^\wedge},$$

in the  $\infty$ -category  $\mathrm{Pro}(\mathrm{Coh}^+(X))$ . Indeed, this follows from the observation that the map  $\mathbb{L}_X \simeq \mathbb{L}_{X/X_{\mathrm{dR}}}$  (as  $X_{\mathrm{dR}}$  is a final object in the  $\infty$ -category  $\mathrm{AnFMP}_{X/}$ ), in particular  $\mathbb{L}_{X_{\mathrm{dR}}} \simeq 0$ . Using the natural fiber sequence linking cotangent complexes of compositions, we obtain that

$$\mathbb{L}_{Y_{\mathrm{dR}}} \rightarrow \mathbb{L}_{X_{\mathrm{dR}}} \rightarrow \mathbb{L}_{X_{\mathrm{dR}}/Y_{\mathrm{dR}}},$$

thus  $\mathbb{L}_{X_{\mathrm{dR}}/Y_{\mathrm{dR}}} \simeq 0$ , and by using the pullback formula for the relative cotangent complex, we obtain that

$$\mathbb{L}_{Y_X^\wedge/Y} \simeq \mathbb{L}_{X_{\mathrm{dR}}/Y_{\mathrm{dR}}},$$

thus the former is null-homotopic. The conclusion follows.

As a consequence, we have natural identifications

$$\mathbf{T}_{X/Y}^{\text{an}}[1]^\wedge \simeq \mathbf{T}_{X/Y_X^\wedge}^{\text{an}}[1]^\wedge,$$

and clearly  $Y_X^\wedge \simeq (Y_X^\wedge)_X^\wedge$ , the latter statement is a formal consequence of Theorem 2.65. For this reason, we shall assume from the start that  $f: X \rightarrow Y$  is a closed-immersion admitting a relative deformation theory, or in other words an (ind)-closed embedding.

**3.2. General construction in the algebraic case.** We start by recalling the definition of the simplicial object

$$\mathbf{B}_{\text{scaled}}^\bullet \in \text{Fun}(\Delta^{\text{op}}, \text{dSt}_k),$$

introduced in [11, §9.2.2]. Namely, for each  $[n] \in \Delta$ , the object  $\mathbf{B}_{\text{scaled}}^n$  is obtained by gluing  $n + 1$  copies of  $\mathbb{A}_k^1$  together along  $0 \in \mathbb{A}_k^1$ . Moreover, the transition morphisms

$$p_{i,n}: \mathbf{B}_{\text{scaled}}^{n+1} \rightarrow \mathbf{B}_{\text{scaled}}^n, \quad \text{for } i \in \{0, \dots, n\}$$

collapse two given different irreducible components of  $\mathbf{B}_{\text{scaled}}^{n+1}$  into a fixed one in  $\mathbf{B}_{\text{scaled}}^n$ . More explicitly, for  $n = 0$ , we have

$$\mathbf{B}_{\text{scaled}}^0 = \mathbb{A}_k^1,$$

and, for  $n = 1$ ,  $\mathbf{B}_{\text{scaled}}^1 = \text{Spec } k[x, y]/(x^2 - y^2)$ .

*Construction 3.1.* Let  $f: X \rightarrow Y$  denote a morphism in the  $\infty$ -category  $\text{dSt}_k$ . In [11, §9.3], the authors introduced the *parametrized deformation to the normal bundle associated to  $f: X \rightarrow Y$* , as the pullback

$$\begin{array}{ccc} \mathcal{D}_{X/Y}^\bullet & \xrightarrow{\quad\quad\quad} & Y \times \mathbb{A}_k^1 \\ \downarrow & & \downarrow \\ \text{Map}_{/\mathbb{A}_k^1}(\mathbf{B}_{\text{scaled}}^\bullet, X \times \mathbb{A}_k^1) & \longrightarrow & \text{Map}_{/\mathbb{A}_k^1}(\mathbf{B}_{\text{scaled}}^\bullet, Y \times \mathbb{A}_k^1), \end{array}$$

where both  $X \times \mathbb{A}_k^1$  and  $Y \times \mathbb{A}_k^1$  are considered as constant simplicial objects in the  $\infty$ -category  $\text{dSt}_k$ . Assume further that the morphism  $f: X \rightarrow Y$  is a closed immersion admitting a (relative) deformation theory, in the  $\infty$ -category  $\text{dSt}_k^{\text{laft}}$ . As a consequence of [11, Theorem 9.2.3.4], it follows that each component of the simplicial object  $\mathcal{D}_{X/Y}^\bullet$  admits a deformation theory relative to  $X$ .

In particular, the object  $\mathcal{D}_{X/Y}^\bullet$  defines a formal groupoid over the stack  $X \times \mathbb{A}_k^1$ . Moreover, Theorem 5.2.3.4 in loc. cit. allows us to associate to  $\mathcal{D}_{X/Y}^\bullet$  a formal moduli problem under  $X \times \mathbb{A}_k^1$

$$\mathcal{D}_{X/Y} \in \text{FMP}_{X \times \mathbb{A}_k^1 / Y \times \mathbb{A}_k^1},$$

obtained via the construction provided in §5.2.4 in loc. cit. Moreover, by construction the object  $\mathcal{D}_{X/Y} \in (\text{dSt}_k^{\text{laft}})_{X \times \mathbb{A}_k^1 / Y \times \mathbb{A}_k^1}$ . More explicitly, the object  $\mathcal{D}_{X/Y} \in \text{FMP}_{X \times \mathbb{A}_k^1 /}$  is computed as the sifted colimit of the simplicial diagram

$$\mathcal{D}_{X/Y}^\bullet \in \text{Fun}(\Delta^{\text{op}}, \text{FMP}_{X \times \mathbb{A}_k^1 /}),$$

the colimit being computed in  $\text{FMP}_{X \times \mathbb{A}_k^1 /}$ .

**Notation 3.2.** By construction, object  $\mathcal{D}_{X/Y} \in \text{FMP}_{X \times \mathbb{A}_k^1 /}$  admits a natural morphism to  $Y \times \mathbb{A}_k^1$ . We shall denote the  $\infty$ -category of formal moduli problems under  $X \times \mathbb{A}_k^1$  equipped with a morphism of derived stacks to  $Y \times \mathbb{A}_k^1$ , by  $\text{FMP}_{X \times \mathbb{A}_k^1 / Y \times \mathbb{A}_k^1}$ .

**Notation 3.3.** Let  $f: X \rightarrow Y$  be a closed morphism admitting a deformation theory in  $\text{dSt}_k^{\text{laft}}$ . We shall denote by  $p: \mathcal{D}_{X/Y} \rightarrow \mathbb{A}_k^1$  the structural morphism.

We shall now describe certain formal properties of the object  $\mathcal{D}_{X/Y} \in \mathrm{FMP}_{X \times \mathbb{A}_k^1 / Y \times \mathbb{A}_k^1}$ :

**Proposition 3.4.** *Let  $f: X \rightarrow Y$  denote a closed immersion in the  $\infty$ -category  $\mathrm{dSt}_k^{\mathrm{laft}}$  admitting a deformation theory. The following assertions hold:*

- (1) *The fiber of the morphism  $p: \mathcal{D}_{X/Y} \rightarrow \mathbb{A}_k^1$  at the fiber  $\{0\} \subseteq \mathbb{A}_k^1$  identifies naturally with the formal completion*

$$\mathrm{T}_{X/Y}[1]^\wedge \in \mathrm{FMP}_{X/},$$

*of the shifted tangent bundle  $\mathrm{T}_{X/Y}[1] \rightarrow X$  along the zero section*

$$s_0: X \rightarrow \mathrm{T}_{X/Y}[1].$$

- (2) *For  $\lambda \in \mathbb{A}_k^1$  with  $\lambda \neq 0$ , the fiber  $(\mathcal{D}_{X/Y})_\lambda$  canonically identifies with the formal completion*

$$Y_X^\wedge \in \mathrm{dSt}_k^{\mathrm{laft}},$$

*of  $X$  in  $Y$  along the morphism  $f$ .*

- (3) *(Hodge Filtration) There exists a natural sequence of square-zero extensions*

$$X \times \mathbb{A}_k^1 = X^{(0)} \rightarrow X^{(1)} \rightarrow \cdots \rightarrow X^{(n)} \rightarrow \cdots \rightarrow Y,$$

*in  $(\mathrm{dSt}_k^{\mathrm{laft}})_{X \times \mathbb{A}_k^1 / Y \times \mathbb{A}_k^1}$  such that, for each  $n \geq 0$ , the morphism*

$$X^{(n)} \rightarrow X^{(n+1)},$$

*has the structure of a square-zero extension associated to the natural morphism*

$$d: \mathbb{L}_{X^{(n)}} \rightarrow \mathbb{L}_{X^{(n)}/Y} \rightarrow i_{n,*}(\mathrm{Sym}^{n+1}(\mathbb{L}_{X/Y}[-1])[1]),$$

*in the  $\infty$ -category  $\mathrm{Coh}^{\geq n}(X^{(n)})$ , where  $i_n: X \times \mathbb{A}_k^1$  denotes the composite map. In particular, if  $X$  is geometric derived  $k$ -stack almost of finite presentation then so are the  $X^{(n)}$ , for each  $n \geq 0$ .*

- (4) *There exists a natural morphism*

$$\mathrm{colim}_n X^{(n)} \rightarrow \mathcal{D}_{X/Y},$$

*in the  $\infty$ -category  $\mathrm{FMP}_{X \times \mathbb{A}_k^1 / Y \times \mathbb{A}_k^1}$ . Moreover, the latter is an equivalence (and thus so it is when computed in the  $\infty$ -category  $(\mathrm{dSt}_k^{\mathrm{laft}})_{X \times \mathbb{A}_k^1 / Y \times \mathbb{A}_k^1}$ ).*

*Proof.* Assertion (1) follows formally from [11, §9, Proposition 2.3.6]. Assertion (2) follows from the observation that the fiber of the simplicial object  $\mathcal{D}_{X/Y}^\bullet$  at  $\lambda \neq 0$  can be identified with the Čech nerve of the morphism  $f$

$$X^{\times_Y \bullet} \in \mathrm{Fun}(\Delta^{\mathrm{op}}, \mathrm{dSt}_k^{\mathrm{laft}}).$$

Therefore, its colimit taken in  $\mathrm{FMP}_{X \times \mathbb{A}_k^1 /}$  agrees with the formal completion  $Y_X^\wedge \in \mathrm{FMP}_{X \times \mathbb{A}_k^1 /}$ . Moreover, [11, §9, Theorem 5.1.3] allow us to construct, for each  $n \geq 0$ , a square-zero extension

$$X^{(n)} \rightarrow X^{(n+1)}, \tag{3.1}$$

with  $X^{(0)} = X \times \mathbb{A}_k^1$  and such that

$$\mathcal{D}_{X/Y} \simeq \mathrm{colim}_{n \geq 0} X^{(n)},$$

in the  $\infty$ -category  $\mathrm{FMP}_{X \times \mathbb{A}_k^1 /}$ , see for instance [11, §9, Proposition 5.2.2]. Denote by  $i_n: X \times \mathbb{A}_k^1 \rightarrow X^{(n)}$  the composite. Let us sketch how the construction of (3.1) proceeds: Theorem 9.5.1.3, in loc. cit., implies that the (Serre) tangent complex

$$\mathrm{T}_{X^{(n)}/Y} \in \mathrm{IndCoh}(X^{(n)}),$$

admits a natural filtration whose  $n$ -th piece identifies with  $i_{n,*}^{\mathrm{IndCoh}}(\mathrm{Sym}^{n+1}(\mathbb{T}_{X/Y}[1]))[-1]$ . For this reason, we have a structural morphism

$$i_{n,*}^{\mathrm{IndCoh}}(\mathrm{Sym}^{n+1}(\mathbb{T}_{X/Y}[1]))[-1] \rightarrow \mathbb{T}_{X^{(n)}/Y},$$

in the  $\infty$ -category  $\mathrm{IndCoh}(X^{(n)})$ . The authors then define, for each  $n \geq 0$ , the square-zero extension displayed in (3.1) by means of the natural composite

$$i_{n,*}^{\mathrm{IndCoh}}(\mathrm{Sym}^{n+1}(\mathbb{T}_{X/Y}[1]))[-1] \rightarrow \mathbb{T}_{X^{(n)}/Y} \rightarrow \mathbb{T}_{X^{(n)}},$$

in the  $\infty$ -category  $\mathrm{IndCoh}(X)$ . We shall now further identify the corresponding derivation in terms of the (usual) cotangent complex formalism. By applying the usual Serre duality functor (c.f. [10, §9]) we obtain a well defined fiber sequence

$$\mathbb{L}_{X^{(n)}} \rightarrow \mathbb{L}_{X^{(n)}/Y} \rightarrow \mathbf{D}_{X^{(n)}}^{\mathrm{Serre}}((i_n^*)^{\mathrm{IndCoh}} \mathrm{Sym}^{n+1}(\mathbb{T}_{X/Y}[1]))[-1],$$

in the  $\infty$ -category  $\mathrm{Pro}(\mathrm{Coh}^b(X))$ , which actually takes place in the full subcategory  $\mathrm{Coh}^+(X)$  via the equivalence of  $\infty$ -categories provided in [11, Corollary 1.4.4.2]. Since nil-isomorphisms are proper morphism (c.f. [25, Tag 0CYK]) we obtain in particular that

$$i_{n-1}: X \times \mathbb{A}_k^1 \rightarrow X^{(n)},$$

is a proper morphism. Combining [10, Corollary 9.5.9 (b)] with [10, Proposition 3.1.3] and [11, Corollary 1.4.4.2], we obtain an equivalence

$$\mathbf{D}_{X^{(n)}}^{\mathrm{Serre}}((i_{n,*})^{\mathrm{IndCoh}} \mathrm{Sym}^{n+1}(\mathbb{T}_{X/Y}[1]))[-1] \simeq i_{n,*}(\mathrm{Sym}^{n+1}(\mathbb{L}_{X/Y}[-1])[1]),$$

in the  $\infty$ -category  $\mathrm{Coh}^+(X^{(n)})$ . Combining the above considerations we are able to identify the derivation  $d^{(n)}$  with the natural morphism

$$\mathbb{L}_{X^{(n)}} \rightarrow \mathbb{L}_{X^{(n)}/Y} \rightarrow i_{n,*}(\mathrm{Sym}^{n+1}(\mathbb{L}_{X/Y}[1]))[-1],$$

in  $\mathrm{Coh}^+(X_\alpha^{(n)})$ . It follows further from [20, Lemma 5.36] that

$$i_{n,*}(\mathrm{Sym}^{n+1}(\mathbb{L}_{X/Y}[1]))[-1] \in \mathrm{Coh}^{\geq n}(X^{(n)}).$$

Assertion (4) follows immediately from [11, §9, Proposition 5.2.2].  $\square$

*Construction 3.5.* Let  $f: X \rightarrow Y$  denote a closed immersion admitting a deformation theory in the  $\infty$ -category  $\mathrm{dSt}_k^{\mathrm{laft}}$ . In [11, §9.2.5] the authors construct an explicit left-lax action of the monoid-scheme object  $\mathbb{A}_k^1$  (with respect to *multiplication*) on the deformation to the normal bundle  $\mathcal{D}_{X/Y}$ . The above action implies that the structure sheaf of  $\mathcal{D}_{X/Y}$  is equipped with a (positively indexed) filtration. This filtration can be made explicit at the fiber at  $\{0\} \subseteq \mathbb{A}_k^1$ . Indeed, under the natural identification

$$(\mathcal{D}_{X/Y})_0 \simeq \mathbb{T}_{X/Y}^\wedge[1],$$

we obtain that the filtration on  $\mathcal{D}_{X/Y}$  induces the natural filtration on  $\mathbb{T}_{X/Y}^\wedge[1]$  which is obtained by considering

$$\mathbb{T}_{X/Y} \in \mathrm{IndCoh}(X)^{\mathrm{gr},=1} \subseteq \mathrm{IndCoh}(X)^{\mathrm{gr},\geq 0},$$

using notations as in [11, §9.2.5.2]. Moreover, the construction of the Hodge filtration in Proposition 3.4 (3) is naturally  $\mathbb{A}_k^1$  left-lax equivariant and the equivalence in Proposition 3.4 (4) is  $\mathbb{A}_k^1$  left-lax equivariant, as well.

*Remark 3.6.* Notice that we can identify  $\mathbb{T}_{X/Y}[1] \simeq \mathrm{Spec}_X(\mathrm{Sym}(\mathbb{L}_{X/Y}[-1]))$ , therefore the deformation  $\mathcal{D}_{X/Y}$  is a derived analogue of the usual deformation to the normal cone associated to a smooth morphism.

*Remark 3.7.* Consider the sequence of square-zero extensions constructed in Proposition 3.4,  $\{X^{(n)}\}_{n \geq 0}$ . The latter defines a filtration on the global sections of the formal completion  $Y_X^\wedge$ , which we shall refer to as the *Hodge filtration associated to the morphism  $f$* . Therefore, Proposition 3.4 can be interpreted as a spreading out result of the Hodge filtration from de Rham cohomology to the global sections of the formal completion.

*Remark 3.8.* Let  $g: B \rightarrow A$  be a morphism in  $\mathbf{CAlg}_k$  such that the induced ring homomorphism

$$\pi_0(B) \rightarrow \pi_0(A),$$

is surjective. Assume that we can find a simplicial polynomial resolution  $P_\bullet \rightarrow B$ , together with a simplicial ideal  $I_\bullet \subseteq P_\bullet$  such that the simplicial object  $P_\bullet/I_\bullet$  given by the formula

$$[n] \in \Delta^{\text{op}} \mapsto P_n/I_n,$$

is a simplicial resolution for  $A$ , by ordinary  $k$ -algebras. Then we have equivalences

$$\operatorname{colim}_{\Delta^{\text{op}}} \mathbb{L}_{P_\bullet} \simeq \mathbb{L}_B \quad \text{and} \quad \operatorname{colim}_{\Delta^{\text{op}}} \mathbb{L}_{P_\bullet/I_\bullet} \simeq \mathbb{L}_A,$$

in  $\mathbf{Mod}_B$ , resp. in  $\mathbf{Mod}_A$ . By taking the cone of the natural morphism  $A \otimes_B \mathbb{L}_B \rightarrow \mathbb{L}_A$  we obtain an equivalence

$$\operatorname{colim}_{\Delta^{\text{op}}} \mathbb{L}_{(P_\bullet/I_\bullet)/P_\bullet} \simeq \mathbb{L}_{A/B}.$$

[11, §9, Proposition 5.1.3] implies that the natural deformation of the (spectrum of)  $g: B \rightarrow A$  is stable under sifted colimits. More precisely, for each  $m \geq 0$  we denote  $P_\bullet^{(m)}$  the derived global sections of the  $m$ -th piece of the Hodge filtration applied componentwise to  $P_\bullet$ , and consider similarly  $(P_\bullet/I_\bullet)^{(m)} \in \mathbf{Fun}(\Delta^{\text{op}}, \mathbf{CAlg}_k)$  and  $A^{(m)} \in \mathbf{CAlg}_k$ . We then have a natural identification

$$\operatorname{colim}_{\Delta^{\text{op}}} \operatorname{Sym}^m(\mathbb{L}_{(P_\bullet/I_\bullet)/P_\bullet}) \simeq \operatorname{Sym}^m(\mathbb{L}_{A/B}),$$

and similarly

$$\operatorname{colim}_{\Delta^{\text{op}}} \mathbb{L}_{(P_\bullet/I_\bullet)^{(m)}/P_\bullet^{(m)}} \simeq \mathbb{L}_{A^{(m)}/B},$$

as  $A^{(m)}$ -modules. By the naturality of [11, §9, Proposition 5.1.3] we obtain that the geometric realization of the natural composites

$$d_{[n]}^{(m)}: \mathbb{L}_{(P_{[n]}/I_{[n]})^{(m)}} \rightarrow \mathbb{L}_{(P_{[n]}/I_{[n]})^{(m)}/P_{[n]}} \rightarrow \operatorname{Sym}^{m+1}(\mathbb{L}_{(P_{[n]}/I_{[n]})/P_{[n]}}[-1])[1],$$

for  $[n] \in \Delta$ , identifies with the natural derivation

$$d^{(m)}: \mathbb{L}_{A^{(m)}} \rightarrow \mathbb{L}_{A^{(m)}/B} \rightarrow \operatorname{Sym}^{m+1}(\mathbb{L}_{A/B}[-1])[1],$$

of [11, §9.5.1].

It turns out that for closed immersions the Hodge filtration on  $Y_X^\wedge$  can be naturally identified with the corresponding  $I$ -adic filtration:

**Lemma 3.9.** *Let  $f: X \rightarrow Y$  be a closed morphism in the  $\infty$ -category  $(\mathbf{dAff}_k)^{\text{laft}}$ . Denote by  $A = \Gamma(X, \mathcal{O}_X)$  and  $B = \Gamma(Y, \mathcal{O}_Y)$ , the corresponding derived global sections. Let  $I := \operatorname{fib}(B \rightarrow A)$  denote the fiber of the induced morphism of derived  $k$ -algebras  $B \rightarrow A$ . Then the Hodge filtration on the formal completion  $Y_X^\wedge$  constructed in Proposition 3.4 identifies with the  $I$ -adic filtration on  $B$ , by taking derived global sections.*

*Proof.* We first observe that the statement of [11, Corollary 9.5.2.5] implies, taking the Serre dual in  $\mathbf{IndCoh}$ , that one has an equivalence

$$\mathcal{O}_{Y_X^\wedge} \simeq \lim_{n \geq 0} \mathcal{O}_{X^{(n)}},$$

and thus, by taking derived global sections, one obtains a natural identification

$$B_I^\wedge \simeq \lim_{n \geq 0} \Gamma(X^{(n)}, \mathcal{O}_{X^{(n)}}),$$

in the  $\infty$ -category  $\mathrm{CAlg}_k$ . Let us first prove the statement in the case where  $A$  and  $B$  are assumed to be ordinary  $k$ -algebras and the (classical) ideal  $I \subseteq B$  is generated by a regular sequence. In this case, we have an identification

$$\mathbb{L}_{A/B} \simeq I/I^2[1],$$

see for instance [25, Tag 08SJ]. In particular, the  $n$ -th piece of the filtration of the Hodge filtration in Proposition 3.4 (3) can be identified with

$$\mathrm{Sym}^n(\mathbb{L}_{A/B}[-1]) \simeq I^n/I^{n+1},$$

where the latter equivalence follows again by the fact that  $I$  is generated by a regular sequence in  $\pi_0(B)$ . In particular, we deduce, by induction, a natural identification between the fiber sequence

$$\mathrm{Sym}^{n+1}(\mathbb{L}_{A/B}[-1]) \rightarrow \mathrm{Sym}^{\leq n+1}(\mathbb{L}_{A/B}[-1]) \rightarrow \mathrm{Sym}^{\leq n}(\mathbb{L}_{A/B}[-1]),$$

and the fiber sequence

$$I^n/I^{n+1} \rightarrow B/I^{n+1} \rightarrow B/I^n,$$

of  $B$ -modules. It then follows from [11, Theorem 9.5.1.3] that, for each  $n \geq 0$ , we have a natural identification

$$X^{(n)} \simeq \mathrm{Spec}(A/I^{n+1}),$$

as desired. Let us now prove the assertion in general. [24, §II. 4, Theorem 4] implies that the *simplicial* category of pairs  $(A, I)$  where  $A$  is a simplicial  $k$ -algebra and  $I$  a simplicial ideal of  $A$  admits a model structure such that: a pair  $(A, I)$  is a fibration (resp., trivial fibration) if and only if both  $A$  and  $I$  are simultaneously fibrations (resp., trivial fibrations) of simplicial sets. Moreover, the cofibrant objects correspond to pairs  $(P, J)$  where, for each  $[n] \in \Delta$ ,  $P_n$  is a polynomial  $k$ -algebra on a set  $X_n$  and  $J_n$  an ideal defined by a subset  $Y_n \subseteq X_n$ , both preserved by degeneracies.

In particular, if  $(P, J)$  is cofibrant then  $J_n$  is termwise generated by a regular sequence. As a consequence, we deduce that the every object of the full subcategory  $\mathrm{Fun}_{\mathrm{closed}}(\Delta^1, \mathrm{CAlg}_k) \subseteq \mathrm{Fun}(\Delta^1, \mathrm{CAlg}_k)$  spanned by those morphisms  $B \rightarrow A$  for which  $\pi_0(B) \rightarrow \pi_0(A)$  is a surjection of ordinary  $k$ -algebras, can be realized as a sifted colimit of local complete intersection morphisms between ordinary  $k$ -algebras. In particular, we can find a simplicial pair  $(P_\bullet, I_\bullet)$  where  $P_\bullet$  is polynomial and  $I_n \subseteq P_n$  a regular ideal together with equivalences

$$\mathrm{colim}_{\Delta^{\mathrm{op}}} P_\bullet \simeq B \quad \text{and} \quad \mathrm{colim}_{\Delta^{\mathrm{op}}} P_\bullet/I_\bullet \simeq A,$$

in  $\mathrm{CAlg}_k$ . Thanks to Remark 3.8, the Hodge filtration constructed in Proposition 3.4 (3) satisfies, for each  $n \geq 0$ ,

$$\begin{aligned} A^{(n)} &:= \Gamma(X^{(n)}, \mathcal{O}_{X^{(n)}}) \\ &\simeq \mathrm{colim}_{\Delta^{\mathrm{op}}} (P_\bullet/I_\bullet)^{(n)}, \end{aligned}$$

where  $(P_\bullet/I_\bullet)^{(n)}$  denotes the global sections of the  $n$ -th piece of the Hodge filtration for the simplicial morphism

$$P_\bullet \rightarrow P_\bullet/I_\bullet,$$

in the  $\infty$ -category  $\mathrm{Fun}(\Delta^{\mathrm{op}}, \mathrm{CAlg}_k)$ . Therefore, we deduce the statement in the general case by the local complete intersection one by observing that

$$B/I^n \simeq \mathrm{colim}_{\Delta^{\mathrm{op}}} P_\bullet/I_\bullet^n.$$

We thus conclude that  $X^{(n)} \simeq \operatorname{Spec}(B/I^n)$ , for each  $n \geq 0$ , as desired.  $\square$

**3.3. The construction of the deformation in the affinoid case.** The goal in this section is to study the deformation to the normal cone in the non-archimedean setting. Let us assume that we are given a closed immersion

$$f: X \rightarrow Y,$$

in the  $\infty$ -category  $\operatorname{dAfd}_k$ . Consider the object

$$\mathbf{B}_{\text{scaled}}^{\text{an}, \bullet}: \Delta^{\text{op}} \rightarrow (\operatorname{dAnSt}_k)_{/\mathbf{A}_k^1},$$

obtained as the analytification of the simplicial object  $\mathbf{B}_{\text{scaled}}^{\bullet} \in \operatorname{Fun}(\Delta^{\text{op}}, \operatorname{dSt}_k^{\text{laft}})$  described in the previous section.

**Definition 3.10.** We define the *non-archimedean parametrized deformation to the normal bundle* via the pullback diagram

$$\begin{array}{ccc} \mathcal{D}_{X/Y}^{\text{an}, \bullet} & \longrightarrow & Y \times \mathbf{A}_k^1 \\ \downarrow & & \downarrow \\ \mathbf{Map}_{/\mathbf{A}_k^1}(\mathbf{B}^{\text{an}, \bullet}, X \times \mathbf{A}_k^1) & \longrightarrow & \mathbf{Map}_{/\mathbf{A}_k^1}(\mathbf{B}^{\text{an}, \bullet}, Y \times \mathbf{A}_k^1) \end{array},$$

computed in the  $\infty$ -category  $\operatorname{Fun}(\Delta^{\text{op}}, \operatorname{dAnSt}_k)$ .

*Remark 3.11.* As in the algebraic case, the object  $\mathcal{D}_{X/Y}^{\text{an}, \bullet}$  admits a natural left-lax action of the multiplicative monoid object  $\mathbf{A}_k^1 \in \operatorname{dAnSt}_k$ .

*Remark 3.12.* Notice that the natural morphism

$$\mathcal{D}_{X/Y}^{\text{an}, \bullet} \rightarrow Y \times \mathbf{A}_k^1,$$

factors naturally via a uniquely defined induced morphism

$$\mathcal{D}_{X/Y}^{\text{an}, \bullet} \rightarrow X \times \mathbf{A}_k^1 \xrightarrow{f \times \operatorname{id}} Y \times \mathbf{A}_k^1.$$

**Notation 3.13.** Let  $f: X \rightarrow Y$  be as above. We shall denote by  $A := \Gamma(Y, \mathcal{O}_Y^{\text{alg}})$ ,  $B := \Gamma(X, \mathcal{O}_X^{\text{alg}})$  and furthermore  $Y^{\text{alg}} := \operatorname{Spec} A$  and  $X^{\text{alg}} := \operatorname{Spec} B$ .

Thanks to [22, Proposition 3.14], we deduce that the induced morphism

$$f^{\text{alg}}: X^{\text{alg}} \rightarrow Y^{\text{alg}},$$

is a closed immersion of Noetherian affine derived  $k$ -schemes. Our next goal is to show that the parametrized deformation associated to the morphism  $f^{\text{alg}}$  recovers the non-archimedean one for  $f$  via the relative analytification functor  $(-)^{\text{an}}_Y$ , see [23, Definition 6.4.] for a definition of the latter notion.

We shall need a preliminary lemma:

**Lemma 3.14.** *Consider the closed immersion  $f^{\text{alg}}: X^{\text{alg}} \rightarrow Y^{\text{alg}}$ , above. There exists a filtered  $\infty$ -category  $\mathcal{I}$  and a diagram*

$$F: \mathcal{I}^{\text{op}} \rightarrow \operatorname{Fun}(\Delta^1, \operatorname{dAff}_k^{\text{laft}}),$$

*such that, for each  $\alpha \in \mathcal{I}$ , we have that*

$$F(\alpha) := (f_\alpha: X_\alpha \rightarrow Y_\alpha),$$

is a closed immersion in the  $\infty$ -category  $\mathrm{dAff}_k^{\mathrm{laft}}$  and such that

$$f \simeq \lim_{j \in \mathcal{J}} F,$$

in the  $\infty$ -category  $\mathrm{Fun}(\Delta^1, \mathrm{dAff}_k)$ .

*Proof.* Consider the model structure on the simplicial category of pairs  $(A, I)$  where  $A$  is a simplicial  $k$ -algebra and  $I$  a simplicial ideal of  $A$  provided by [24, §II. 4, Theorem 4], also described in the proof of Proposition 3.4.

Let  $B := \Gamma(Y, \mathcal{O}_Y)$  and  $A := \Gamma(X, \mathcal{O}_X)$  be as usual and consider the induced morphism  $B \rightarrow A$  in  $\mathrm{CAlg}_k$ . Denote by  $I := \mathrm{fib}(B \rightarrow A)$ . By our assumption on  $f$  we conclude that  $I$  is 1-connective as a  $B$ -module.

We can find a simplicial resolution  $(P_\bullet, I_\bullet) \rightarrow (B, I)$  by pairs of polynomial  $k$ -algebras  $P_n$  on sets  $X_n$  together with an ideal  $I_n \subseteq P_n$  on a subset  $Y_n \subseteq X_n$  (possibly infinite). We further have that

$$\mathrm{colim}_{\Delta^{\mathrm{op}}} P_\bullet / I_\bullet \simeq A,$$

in the  $\infty$ -category  $\mathrm{CAlg}_k$ . For each  $n \geq 0$ , We can approximate the pairs  $(X_n, Y_n)$  by finite sets  $(X_{n,\alpha}, Y_{n,\alpha})$  for  $\alpha \in \mathcal{J}$  where  $\mathcal{J}$  is a filtered category. In this manner, by taking the respective polynomial resolutions we obtain a filtered diagram

$$F: \mathcal{J} \rightarrow \mathrm{Fun}(\Delta^1, \mathrm{CAlg}_k),$$

such that  $\mathrm{colim}_I F \simeq (B \rightarrow A)$  and, for each  $\alpha \in \mathcal{J}$ , we have that

$$(f_\alpha: B_\alpha \rightarrow A_\alpha) := F(\alpha),$$

is surjective on  $\pi_0$  and both  $B_\alpha, A_\alpha \in \mathrm{CAlg}_k^{\mathrm{laft}}$ . The result now follows.  $\square$

*Construction 3.15.* Consider the object  $\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}}^\bullet \in \mathrm{Fun}(\Delta^{\mathrm{op}}, \mathrm{dAff}_k)$  as in Construction 3.1. It is clear from the description of  $\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}}^\bullet$  given in Construction 3.1 that one has a natural equivalence of derived stacks

$$\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}}^\bullet \simeq \lim_{\alpha \in I^{\mathrm{op}}} \mathcal{D}_{X_\alpha^{\mathrm{alg}}/Y_\alpha^{\mathrm{alg}}}^\bullet,$$

in the  $\infty$ -category  $\mathrm{Fun}(\Delta^{\mathrm{op}}, \mathrm{dSt}_k)$ .

We are now able to prove the following easy lemma:

**Lemma 3.16.** *Let  $f: X \rightarrow Y$  be a closed immersion in  $\mathrm{dAfd}_k$ . Then one has a natural equivalence*

$$(f^{\mathrm{alg}})_Y^{\mathrm{an}} \simeq f,$$

in the  $\infty$ -category  $\mathrm{Fun}(\Delta^{\mathrm{op}}, \mathrm{dAfd}_k)$ .

*Proof.* Let  $f^{\mathrm{alg}}: \mathrm{Spec} B \rightarrow \mathrm{Spec} A$  be the induced morphism, where  $B := \Gamma(X, \mathcal{O}_X^{\mathrm{alg}})$  and  $A := \Gamma(Y, \mathcal{O}_Y^{\mathrm{alg}})$ . It follows readily from the definitions that the morphism  $f^{\mathrm{alg}}$  of derived affine schemes is a closed immersion. Moreover, we have a natural identification

$$(\mathrm{Spec}(A)^{\mathrm{alg}})_Y^{\mathrm{an}} \simeq Y.$$

For this reason, the commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ \downarrow & & \downarrow \simeq \\ (X^{\mathrm{alg}})_Y^{\mathrm{an}} & \xrightarrow{(f^{\mathrm{alg}})_Y^{\mathrm{an}}} & (Y^{\mathrm{alg}})_Y^{\mathrm{an}}, \end{array}$$

induces an equivalence at the level of global sections

$$\Gamma(X, \mathcal{O}_X^{\mathrm{alg}}) \simeq \Gamma((X^{\mathrm{alg}})_Y^{\mathrm{an}}, \mathcal{O}_{(X^{\mathrm{alg}})_Y^{\mathrm{an}}}^{\mathrm{alg}}).$$

The result now follows immediately from the fact that both  $X$  and  $(X^{\text{alg}})_Y^{\text{an}}$  are derived  $k$ -affinoid spaces together with the derived Tate acyclicity's theorem, c.f. [21, Theorem 3.1].  $\square$

**Lemma 3.17.** *Let notations be as above. Then one has a natural equivalence*

$$\mathcal{D}_{X/Y}^{\mathrm{an}, \bullet} \simeq (\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}}^{\bullet})_Y^{\mathrm{an}},$$

where  $(-)_Y^{\text{an}}$  denotes the relative analytification with respect to  $Y$ .

*Proof.* As before, write the closed immersion of affine schemes

$$f: X^{\text{alg}} \rightarrow Y^{\text{alg}},$$

as a cofiltered limit

$$\lim_{\alpha \in I^{\text{op}}} f_\alpha: \lim_{\alpha \in I^{\text{op}}} X_\alpha^{\text{alg}} \rightarrow \lim_{\alpha \in I^{\text{op}}} Y_\alpha^{\text{alg}},$$

where for each index  $\alpha \in I$ , both  $X_\alpha$  and  $Y_\alpha$  are affine schemes of almost of finite presentation. Since the natural projection morphism

$$\mathbf{B}_{\text{scaled}}^{\bullet} \rightarrow \mathbb{A}_k^1,$$

where  $\mathbb{A}_k^1$  is considered as a constant simplicial object in  $\mathbf{dSt}_k$ , is a proper morphism, we deduce from [15, Theorem 6.13] that for every  $\alpha$ , the natural morphisms

$$\mathrm{Map}_{/\mathbb{A}_k^1}(\mathbf{B}_{\mathrm{scaled}}^\bullet, X_\alpha^{\mathrm{alg}} \times \mathbb{A}_k^1)^{\mathrm{an}} \rightarrow \mathbf{Map}_{/\mathbf{A}_k^1}(\mathbf{B}_{\mathrm{scaled}}^{\bullet, \mathrm{an}}, (X_\alpha^{\mathrm{alg}})^{\mathrm{an}} \times \mathbf{A}_k^1)$$

$$\mathrm{Map}_{/\mathbb{A}_k^1}(\mathbf{B}_{\mathrm{scaled}}^\bullet, Y_\alpha^{\mathrm{alg}} \times \mathbb{A}_k^1)^{\mathrm{an}} \rightarrow \mathbf{Map}_{/\mathbf{A}_k^1}(\mathbf{B}_{\mathrm{scaled}}^{\bullet, \mathrm{an}}, (Y_\alpha^{\mathrm{alg}})^{\mathrm{an}} \times \mathbf{A}_k^1)$$

are equivalences in the  $\infty$ -category  $\mathbf{dAnSt}_k$ . Therefore, the natural morphism

$$(\mathcal{D}_{X_\alpha^{\text{alg}}/Y_\alpha^{\text{alg}}}^\bullet)^{\text{an}} \rightarrow \mathcal{D}_{(X_\alpha^{\text{alg}})^{\text{an}}/(Y_\alpha^{\text{alg}})^{\text{an}}}^{\bullet, \text{an}},$$

is an equivalence in the  $\infty$ -category  $\mathbf{dAnSt}_k$ . Observe further that for every  $\alpha \in A$  the mapping stacks

$$\mathrm{Map}_{/\mathbb{A}_k^1}(\mathbf{B}_{\mathrm{scaled}}^\bullet, X_\alpha^{\mathrm{alg}} \times \mathbb{A}_k^1) \quad \text{and} \quad \mathrm{Map}_{/\mathbb{A}_k^1}(\mathbf{B}_{\mathrm{scaled}}^\bullet, Y_\alpha^{\mathrm{alg}} \times \mathbb{A}_k^1)$$

are affine schemes and therefore it follows by the construction of the analytification functor

$$(-)^{\text{an}}: \text{dAff}_k \rightarrow \text{dAnSt}_k,$$

as a right Kan extension of the usual analytification functor

$$(-)^{\text{an}}: \text{dAff}_k^{\text{laft}} \rightarrow \text{dAn}_k,$$

that we have natural equivalences

$$(\lim_{\alpha} \mathrm{Map}_{/\mathbb{A}_k^1}(\mathbf{B}_{\mathrm{scaled}}^{\bullet}, X_{\alpha}^{\mathrm{alg}} \times \mathbb{A}_k^1))^{\mathrm{an}} \simeq \mathbf{Map}_{/\mathbb{A}_k^1}(\mathbf{B}_{\mathrm{scaled}}^{\bullet, \mathrm{an}}, (X^{\mathrm{alg}})_Y^{\mathrm{an}} \times \mathbb{A}_k^1)$$

$$(\lim_{\alpha} \mathbf{Map}_{/\mathbb{A}_k^1}(\mathbf{B}_{\text{scaled}}^{\bullet}, Y_{\alpha}^{\text{alg}} \times \mathbb{A}_k^1))^{\text{an}} \simeq \mathbf{Map}_{/\mathbb{A}_k^1}(\mathbf{B}_{\text{scaled}}^{\bullet, \text{an}}, (Y_Y^{\text{alg}})^{\text{an}} \times \mathbb{A}_k^1).$$

in the  $\infty$ -category  $(\mathrm{dAnSt}_k)_{X \times \mathbb{A}^1 // Y \times \mathbb{A}_k^1}$ . The result now follows from the existence of a commutative cube

$$\begin{array}{ccccc}
(\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}}^\bullet)^{\mathrm{an}}_Y & \xrightarrow{\quad} & Y \times \mathbf{A}_k^1 & \searrow & \\
\downarrow & \searrow & \downarrow & \xrightarrow{\quad} & (Y^{\mathrm{alg}} \times \mathbf{A}_k^1)^{\mathrm{an}} \\
& & (\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}}^\bullet)^{\mathrm{an}} & \xrightarrow{\quad} & \\
\mathrm{Map}_{/\mathbf{A}_k^1}(\mathbf{B}^\bullet, X \times \mathbf{A}_k^1) & \xrightarrow{\quad} & \mathrm{Map}_{/\mathbf{A}_k^1}(\mathbf{B}^\bullet, Y \times \mathbf{A}_k^1) & \searrow & \\
& \searrow & \downarrow & \xrightarrow{\quad} & \downarrow \\
& & \mathrm{Map}_{/\mathbf{A}_k^1}(\mathbf{B}^\bullet, (X^{\mathrm{alg}})^{\mathrm{an}} \times \mathbf{A}_k^1) & \xrightarrow{\quad} & \mathrm{Map}_{/\mathbf{A}_k^1}(\mathbf{B}^\bullet, (Y^{\mathrm{alg}})^{\mathrm{an}} \times \mathbf{A}_k^1)
\end{array}$$

whose top and front squares are fiber products in  $\mathrm{dAnSt}_k$ , and thus so it is the back square, as desired.  $\square$

**Corollary 3.18.** *Let  $f: X \rightarrow Y$  be a closed morphism in  $\mathrm{dAfd}_k$ . Then one has a natural identification*

$$(\mathcal{D}_{X/Y}^{\bullet, \mathrm{an}})_0 \simeq (\mathbf{T}_{X/Y}^{\mathrm{an}, \bullet})^\wedge,$$

where the latter denotes the commutative group object associated to the formal completion of the tangent bundle of  $f$  along the zero section  $s_0: X \rightarrow \mathbf{T}_{X/Y}^{\mathrm{an}, \bullet}$ .

*Proof.* The result follows from [11, Proposition 9.2.3.6] combined with the fact that relative analytification commutes with tangent bundles and formal completions, [15, Corollary 5.20].  $\square$

The following result is an immediate consequence of Lemma 3.17:

**Lemma 3.19.** *For each  $[n] \in \Delta$ , the object  $\mathcal{D}_{X/Y}^{\mathrm{an}, [n]} \in (\mathrm{dAnSt}_k)_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1}$  admits a deformation theory and it is furthermore affinoid.*

*Proof.* We shall prove that each component of the simplicial object

$$\mathcal{D}_{X/Y}^{\mathrm{an}, \bullet} \in \mathrm{Fun}(\Delta^{\mathrm{op}}, \mathrm{AnFMP}_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1}),$$

admits a deformation theory. By [11, Lemma 2.3.2], it follows that  $\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}}^{\bullet}$  is an object in  $\mathrm{FMP}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}}$ . The result now follows by applying the relative analytification functor  $(-)_Y^{\mathrm{an}}$  together with [23, Proposition 6.10]. The fact that  $\mathcal{D}_{X/Y}^{\mathrm{an}, [n]}$  is affinoid, for every  $[n] \in \Delta^{\mathrm{op}}$ , follows readily from the observation that for every  $\lambda \in \mathbb{A}_k^1$  the fiber

$$(\mathcal{D}_{X/Y}^{\mathrm{an}, \bullet})_\lambda \in \mathrm{dAfd}_k.$$

$\square$

*Remark 3.20.* It follows immediately from Lemma 3.19 together with the definitions that the object

$$(X \times \mathbf{A}_k^1 \rightarrow \mathbf{D}_{X/Y}^{\bullet, \mathrm{an}} \rightarrow X \times \mathbf{A}_k^1) \in (\mathrm{dAnSt}_k)_{X \times \mathbf{A}_k^1 // X \times \mathbf{A}_k^1},$$

belongs to the full subcategory  $\mathrm{AnFMP}_{X \times \mathbf{A}_k^1 // X \times \mathbf{A}_k^1}$ .

*Construction 3.21.* The  $\infty$ -category  $\mathrm{AnFMP}_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1}$  is presentable and in particular it admits sifted colimits. Thanks to Lemma 3.19, we can consider the object

$$\mathcal{D}_{X/Y}^{\mathrm{an}} := \mathrm{colim}_{\Delta^{\mathrm{op}}} \mathcal{D}_{X/Y}^{\mathrm{an}, \bullet} \in \mathrm{AnFMP}_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1}.$$

Similarly, we consider the sifted colimit

$$\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}} := \mathrm{colim}_{\Delta^{\mathrm{op}}} \mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}}^{\bullet} \in \mathrm{FMP}_{X^{\mathrm{alg}} \times \mathbb{A}_k^1 // Y^{\mathrm{alg}} \times \mathbb{A}_k^1},$$

computed in the  $\infty$ -category  $\mathrm{FMP}_{X^{\mathrm{alg}} \times \mathbb{A}_k^1 // Y^{\mathrm{alg}} \times \mathbb{A}_k^1}$ . We can consider the latter as an object in

$$\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}} \in \mathrm{dSt}_{X^{\mathrm{alg}} \times \mathbb{A}_k^1 // Y^{\mathrm{alg}} \times \mathbb{A}_k^1},$$

and therefore consider its relative analytification  $(\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}})_Y^{\mathrm{an}} \in \mathrm{dAnSt}_{X^{\mathrm{alg}} \times \mathbf{A}_k^1 // Y^{\mathrm{alg}} \times \mathbf{A}_k^1}$ . Thanks to Lemma 3.17 it follows that we have a natural morphism

$$\mathcal{D}_{X/Y}^{\mathrm{an}} \rightarrow (\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}})_Y^{\mathrm{an}},$$

in the  $\infty$ -category  $(\mathrm{dAnSt}_k)_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1}$ .

The following result implies that the relative analytification commutes with the deformation to the normal bundle:

**Proposition 3.22.** *The natural morphism*

$$\theta_{X/Y}: \mathcal{D}_{X/Y}^{\text{an}} \rightarrow (\mathcal{D}_{X^{\text{alg}}/Y^{\text{alg}}})_Y^{\text{an}},$$

*is an equivalence of derived  $k$ -analytic stacks.*

*Proof.* Let us first assume that the closed immersion  $f: X \rightarrow Y$  is an actual nil-embedding. In this case, we have that  $Y \times \mathbf{A}_k^1 \in \text{AnFMP}_{X \times \mathbf{A}_k^1/}$ . Consider now the relative analytification functor

$$(-)_Y^{\text{an}}: \text{FMP}_{/Y^{\text{alg}} \times \mathbb{A}_k^1} \rightarrow \text{AnFMP}_{/Y \times \mathbf{A}_k^1},$$

introduced in [23, §6.1]. Thanks to [23, Theorem 6.12] the natural functor displayed above is an equivalence of  $\infty$ -categories. Observe further that we have a well defined functor

$$(-)_Y^{\text{an}}: \text{FMP}_{X^{\text{alg}} \times \mathbb{A}_k^1 // Y^{\text{alg}} \times \mathbb{A}_k^1} \rightarrow \text{AnFMP}_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1}, \quad (3.2)$$

induced by the usual relative analytification functor. Indeed, we have that

$$X \times \mathbf{A}_k^1 \simeq (X^{\text{alg}})_Y^{\text{an}} \times \mathbf{A}_k^1,$$

as the pair  $((-)^{\text{alg}}, (-)_Y^{\text{an}})$  forms an equivalence itself. It is further clear that (3.2) is an equivalence of  $\infty$ -categories as well. In particular, it commutes with all small colimits. Therefore, we have a chain of natural equivalences

$$\begin{aligned} (\mathcal{D}_{X^{\text{alg}}/Y^{\text{alg}}})_Y^{\text{an}} &\simeq (\text{colim}_{\Delta^{\text{op}}} \mathcal{D}_{X^{\text{alg}}/Y^{\text{alg}}}^\bullet)_Y^{\text{an}} \\ &\simeq \text{colim}_{\Delta^{\text{op}}} (\mathcal{D}_{X^{\text{alg}}/Y^{\text{alg}}}^\bullet)_Y^{\text{an}} \\ &\simeq \text{colim}_{\Delta^{\text{op}}} \mathcal{D}_{X/Y}^{\text{an}, \bullet}, \end{aligned}$$

in  $\text{AnFMP}_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1}$ , thanks to Proposition 3.22. The conclusion now follows from the observation that the forgetful functor

$$\text{AnFMP}_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1} \rightarrow \text{AnFMP}_{X \times \mathbf{A}_k^1/},$$

commutes with colimits and it is moreover conservative, thus it reflects sifted colimits. Let us assume now that  $f: X \rightarrow Y$  is a general closed immersion in  $\text{dAfd}_k$ . We have a natural equivalence

$$\text{colim}_{S \in \text{AnNil}_{X//Y}^\wedge} \mathcal{D}_{X/S} \simeq \mathcal{D}_{X/Y},$$

in the  $\infty$ -category  $\text{AnFMP}_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1}$ . Let

We first observe that, as a consequence of Remark 3.20 and ??, it suffices to prove that the natural morphism

$$\theta_{X/Y}: \mathcal{D}_{X/Y}^{\text{an}} \rightarrow (\mathcal{D}_{X^{\text{alg}}/Y^{\text{alg}}})_Y^{\text{an}},$$

is an equivalence in  $\text{AnFMP}_{X \times \mathbf{A}_k^1 // X \times \mathbf{A}_k^1}$ . By construction, we can compute  $\mathcal{D}_{X/Y}^{\text{an}}$  (resp.,  $(\mathcal{D}_{X^{\text{alg}}/Y^{\text{alg}}})_Y^{\text{an}}$ ) as the sifted colimit of the simplicial object

$$\mathcal{D}_{X/Y}^{\text{an}, \bullet} \in \text{Fun}(\Delta^{\text{op}}, \text{AnFMP}_{X \times \mathbf{A}_k^1/}).$$

Thanks to Lemma 3.17, we deduce that the latter is equivalent to the relative analytification

$$(\mathcal{D}_{X^{\text{alg}}/Y^{\text{alg}}}^\bullet)_Y^{\text{an}} \in \text{Fun}(\Delta^{\text{op}}, \text{AnFMP}_{X \times \mathbf{A}_k^1/}).$$

We further observe that [23, Theorem 6.12] implies that the relative analytification functor

$$(-)_{X \times \mathbf{A}_k^1}^{\text{an}}: \text{FMP}_{/X^{\text{alg}} \times \mathbf{A}_k^{1, \text{alg}}} \rightarrow \text{AnFMP}_{/X \times \mathbf{A}_k^1},$$

is an equivalence. In particular, we deduce that the relative analytification functor at the level of pointed  $\infty$ -categories

$$(-)_{X \times \mathbf{A}_k^1}^{\text{an}} : \text{FMP}_{X^{\text{alg}} \times \mathbf{A}_k^{1, \text{alg}} // X^{\text{alg}} \times \mathbf{A}_k^{1, \text{alg}}} \rightarrow \text{AnFMP}_{X \times \mathbf{A}_k^1 // X \times \mathbf{A}_k^1},$$

is an equivalence of  $\infty$ -categories as well. In particular, taking into consideration the above statements we deduce a chain of natural equivalences

$$\begin{aligned} (\mathcal{D}_{X^{\text{alg}}/Y^{\text{alg}}})_Y^{\text{an}} &\simeq (\mathcal{D}_{X^{\text{alg}}/Y^{\text{alg}}})_X^{\text{an}} \\ &\simeq (\text{colim}_{\Delta_{\text{op}}} \mathcal{D}_{X^{\text{alg}}/Y^{\text{alg}}}^\bullet)_X^{\text{an}} \\ &\simeq \text{colim}_{\Delta_{\text{op}}} (\mathcal{D}_{X^{\text{alg}}/Y^{\text{alg}}}^\bullet)_X^{\text{an}} \\ &\simeq \text{colim}_{\Delta_{\text{op}}} \mathcal{D}_{X/Y}^{\text{an}, \bullet} \\ &\simeq \mathcal{D}_{X/Y}, \end{aligned}$$

in  $\text{AnFMP}_{X \times \mathbf{A}_k^1 // X \times \mathbf{A}_k^1}$ , as desired.  $\square$

**Lemma 3.23.** *Consider the natural projection morphism*

$$q: \mathcal{D}_{X/Y}^{\text{an}} \rightarrow \mathbf{A}_k^1.$$

*Then its fiber at  $\lambda \neq 0$  coincides with the formal completion*

$$Y_X^\wedge,$$

*and its fiber at  $\{0\} \subseteq \mathbf{A}_k^1$  with the completion of the shifted tangent bundle  $\mathbf{T}_{X/Y}^{\text{an}}[1]$  along the zero section  $s_0: X \rightarrow \mathbf{T}_{X/Y}^{\text{an}}[1]$  of the shifted relative tangent bundle,*

$$\mathbf{T}_{X/Y}^{\text{an}}[1]^\wedge \in \text{AnFMP}_{X \times \mathbf{A}_k^1 // X \times \mathbf{A}_k^1}.$$

*Proof.* The above assertions follow immediately from Proposition 3.22 together with Proposition 3.4.  $\square$

**Construction 3.24.** Let  $g: U \rightarrow Y$  be an étale morphism in  $\text{dAfd}_k$ . Consider the pullback diagram

$$\begin{array}{ccc} X_U & \longrightarrow & U \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y, \end{array}$$

computed in the  $\infty$ -category  $\text{dAfd}_k$ . It follows from the definitions that we have a natural pullback square of simplicial objects

$$\begin{array}{ccc} \mathcal{D}_{X_U/U}^{\text{an}, \bullet} & \longrightarrow & \mathcal{D}_{X/Y}^{\text{an}, \bullet} \\ \downarrow & & \downarrow \\ U & \longrightarrow & Y, \end{array}$$

in the  $\infty$ -category  $\text{dAnSt}_k$ . For this reason, we obtain a natural commutative diagram

$$\begin{array}{ccc} \mathcal{D}_{X_U/U}^{\text{an}} & \longrightarrow & \mathcal{D}_{X/Y}^{\text{an}} \\ \downarrow & & \downarrow \\ U & \longrightarrow & Y, \end{array}$$

in the  $\infty$ -category  $\mathrm{dAnSt}_k$ . Similarly, [22, Proposition 3.17] implies that we have a pullback diagram

$$\begin{array}{ccc} X_U^{\mathrm{alg}} & \longrightarrow & U^{\mathrm{alg}} \\ \downarrow & & \downarrow \\ X^{\mathrm{alg}} & \xrightarrow{f^{\mathrm{alg}}} & Y^{\mathrm{alg}} \end{array},$$

in the  $\infty$ -category  $\mathrm{dAff}_k$ . Reasoning as above, we have a natural commutative square

$$\begin{array}{ccc} \mathcal{D}_{X_U^{\mathrm{alg}}/U^{\mathrm{alg}}} & \longrightarrow & \mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}} \\ \downarrow & & \downarrow \\ U^{\mathrm{alg}} & \longrightarrow & Y^{\mathrm{alg}}, \end{array}$$

in the  $\infty$ -category  $\mathrm{dSt}_k$ .

**Proposition 3.25.** *The commutative square*

$$\begin{array}{ccc} \mathcal{D}_{X_U/U}^{\mathrm{an}} & \longrightarrow & \mathcal{D}_{X/Y}^{\mathrm{an}} \\ \downarrow & & \downarrow \\ U & \longrightarrow & Y, \end{array}$$

of Construction 3.24, is a pullback square in the  $\infty$ -category  $\mathrm{dAnSt}_k$ .

*Proof.* In order to show the assertion of the proposition, we are reduced to show that the natural morphism

$$\mathcal{D}_{X_U/U}^{\mathrm{an}} \rightarrow \mathcal{D}_{X/Y}^{\mathrm{an}} \times_Y U,$$

is an equivalence in the  $\infty$ -category  $\mathrm{AnFMP}_{X_U//U}$ . Moreover, Proposition 3.22 reduce us to show that the natural morphism

$$\mathcal{D}_{X_U^{\mathrm{alg}}/U^{\mathrm{alg}}} \rightarrow \mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}} \times_{Y^{\mathrm{alg}}} U^{\mathrm{alg}},$$

is an equivalence in  $\mathrm{dSt}_k$  (see also Proposition 3.22). Find an approximation of the morphism  $f: X^{\mathrm{alg}} \rightarrow Y^{\mathrm{alg}}$  of the form

$$\lim_{\alpha \in I^{\mathrm{op}}} f_\alpha: X_\alpha \rightarrow Y_\alpha,$$

where  $I$  is a filtered  $\infty$ -category and for each  $\alpha \in I$ , the morphism  $f_\alpha$  is a closed immersion of affine derived  $k$ -schemes almost of finite presentation. Similarly, find an approximation

$$U^{\mathrm{alg}} \simeq \lim_{\beta \in J^{\mathrm{op}}} U_\beta.$$

By almost finite presentation we deduce that for every  $\alpha \in I$  there exists an index  $\beta(\alpha) \in J$  such that the composite

$$U^{\mathrm{alg}} \rightarrow Y^{\mathrm{alg}} \rightarrow Y_\alpha, \tag{3.3}$$

factors as

$$U^{\mathrm{alg}} \rightarrow U_{\beta(\alpha)} \rightarrow Y_\alpha,$$

for a well defined morphism  $U_{\beta(\alpha)} \rightarrow Y_\alpha$  in  $\mathrm{dAff}_k^{\mathrm{laft}}$ . Let  $\mathcal{K}$  denote the filtered subcategory of the product  $I \times J$  spanned by those pairs  $(\alpha, \beta) \in I \times J$  such that the composite displayed in (3.3) factors as  $U_\beta \rightarrow Y_\alpha$ . We thus have that the morphism

$$U^{\mathrm{alg}} \rightarrow Y^{\mathrm{alg}},$$

can be written as  $\lim_{(\gamma_1, \gamma_2) \in \mathcal{K}} (U_{\gamma_1} \rightarrow Y_{\gamma_2})$ . For each  $(\gamma_1, \gamma_2) \in \mathcal{K}$  consider the deformations to the normal bundle

$$\mathcal{D}_{X_{\gamma_2}/Y_{\gamma_2}} \quad \text{and} \quad \mathcal{D}_{X_{U_{\gamma_2}}/U_{\gamma_2}},$$

where  $X_{U_{\gamma_2}}$  is defined as the pullback of the diagram

$$U_{\gamma_1} \rightarrow Y_{\gamma_2} \leftarrow X_{\gamma_2}.$$

We claim that for each  $(\gamma_1, \gamma_2) \in \mathcal{K}$ , we have a natural equivalence

$$\mathcal{D}_{X_{U_{\gamma_1}}/U_{\gamma_1}} \simeq \mathcal{D}_{X_{\gamma_2}/Y_{\gamma_2}} \times_{Y_{\gamma_2}} U_{\gamma_1},$$

of derived  $k$ -stacks almost of finite presentation. Indeed, by conservativity of the relative tangent complex, c.f. [11, §5, Theorem 2.3.5], it suffices to show that

$$\mathbb{T}_{X_{U_{\gamma_1}}/\mathcal{D}_{X_{U_{\gamma_1}}/U_{\gamma_1}}} \rightarrow \mathbb{T}_{X_{U_{\gamma_1}}/\mathcal{D}_{X_{\gamma_2}/Y_{\gamma_2}} \times_{Y_{\gamma_2}} U_{\gamma_1}},$$

is an equivalence in the  $\infty$ -category  $\text{IndCoh}(X_{U_{\gamma_1}})$ . Thanks to [11, §5, Corollary 2.3.6], we are reduced to show that the natural morphism of simplicial objects

$$\{\mathbb{T}_{X_{U_{\gamma_1}}/\mathcal{D}_{X_{U_{\gamma_1}}/U_{\gamma_1}}}^\bullet\} \rightarrow \{\mathbb{T}_{X_{U_{\gamma_1}}/\mathcal{D}_{X_{\gamma_2}/Y_{\gamma_2}} \times_{Y_{\gamma_2}} U_{\gamma_1}}^\bullet\},$$

is an equivalence in  $\text{Fun}(\Delta^{\text{op}}, \text{IndCoh}(X_{U_{\gamma_1}}))$ . Passing to the corresponding Serre duals, we obtain an assertion at the level of cotangent complexes. The claim now follows from the fact that the commutative diagram

$$\begin{array}{ccc} \mathcal{D}_{X_{U_{\gamma_1}}/U_{\gamma_1}}^\bullet & \longrightarrow & \mathcal{D}_{X_{\gamma_2}/Y_{\gamma_2}}^\bullet \\ \downarrow & & \downarrow \\ U_{\gamma_1} & \longrightarrow & Y_{\gamma_2} \end{array}$$

is a pullback diagram component-wise in  $\text{dAff}_k^{\text{laft}}$ . The proof is now concluded.  $\square$

**3.4. Gluing the Deformation.** In this §, we globalize the results proved so far in §3.2. Let  $f: X \rightarrow Y$  be a nil-embedding of derived  $k$ -analytic stacks admitting a deformation theory in the  $\infty$ -category  $\text{dAnSt}_k$ , assume further that  $X$  is a geometric derived  $k$ -analytic stack. Then we can consider as before the *deformation to the normal bundle of the morphism  $f$*  constructed via the pullback diagram

$$\begin{array}{ccc} \mathcal{D}_{X/Y}^{\text{an}, \bullet} & \longrightarrow & Y \times \mathbf{A}_k^1 \\ \downarrow & & \downarrow \\ \mathbf{Map}_{/\mathbf{A}_k^1}(\mathbf{B}_{\text{scaled}}^{\text{an}, \bullet}, X \times \mathbf{A}_k^1) & \longrightarrow & \mathbf{Map}_{/\mathbf{A}_k^1}(\mathbf{B}_{\text{scaled}}^{\text{an}, \bullet}, Y \times \mathbf{A}_k^1), \end{array}$$

in the  $\infty$ -category  $\text{dAnSt}_k$ . As in the previous §, one can show that the simplicial object

$$\mathcal{D}_{X/Y}^{\text{an}, \bullet} \in \text{AnFMP}_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1},$$

and in particular we have:

**Proposition 3.26.** *The simplicial object*

$$\mathcal{D}_{X/Y}^{\text{an}, \bullet}: \Delta^{\text{op}} \rightarrow \text{AnFMP}_{X // Y},$$

*admits a colimit  $\mathcal{D}_{X/Y}^{\text{an}} \in \text{AnFMP}_{X/}$ .*

*Proof.* Let  $U_\bullet \rightarrow Y$  be a derived  $k$ -affinoid étale hyper-covering of  $Y$ , in  $\mathrm{dAnSt}_k$ . We have a natural equivalence of  $\infty$ -categories

$$\Psi: (\mathrm{dAnSt}_k)_{/Y} \rightarrow \lim_{\Delta^{\mathrm{op}}} (\mathrm{dAnSt}_k)_{/U_\bullet}.$$

We deduce from the construction of  $\mathcal{D}_{X/Y}^{\mathrm{an}, \bullet}$  that the simplicial object  $\mathcal{D}_{X/Y}^{\mathrm{an}, \bullet}$  satisfies

$$\begin{aligned} \Psi(\mathcal{D}_{X/Y}^{\mathrm{an}, \bullet}) &\simeq \{\mathcal{D}_{X_{U_\bullet}/U_\bullet}^{\mathrm{an}, \bullet}\} \\ &\in \lim_{\Delta^{\mathrm{op}}} (\mathrm{dAnSt}_k)_{/U_\bullet}. \end{aligned}$$

For each  $[n] \in \Delta$  the  $\infty$ -categories  $\mathrm{AnFMP}_{X_{U_{[n]}}//U_{[n]}}$  are presentable. For this reason, we can consider the geometric realization

$$\mathcal{D}_{X_{U_{[n]}}/U_{[n]}}^{\mathrm{an}} \in \mathrm{AnFMP}_{X_{U_{[n]}}/U_{[n]}},$$

for every  $[n] \in \Delta$ . Thanks to Proposition 3.25 we deduce that the above deformations glue to form a uniquely defined object

$$\mathcal{D}_{X/Y}^{\mathrm{an}} \in \mathrm{dAnSt}_k,$$

satisfying the relation

$$\begin{aligned} \Psi(\mathcal{D}_{X/Y}^{\mathrm{an}}) &\simeq \{\mathcal{D}_{X_{U_\bullet}/U_\bullet}^{\mathrm{an}}\} \\ &\in \lim_{\Delta^{\mathrm{op}}} (\mathrm{dAnSt}_k)_{/U_\bullet}. \end{aligned}$$

It is clear from the definitions that  $\mathcal{D}_{X/Y}^{\mathrm{an}} \in \mathrm{AnFMP}_{X//Y}$ . We claim that the latter is a colimit of the diagram

$$\mathcal{D}_{X/Y}^{\mathrm{an}, \bullet}.$$

We need to show that for every  $Z \in \mathrm{AnFMP}_{X//Y}$  together with a morphism

$$\mathcal{D}_{X/Y}^{\mathrm{an}, \bullet} \rightarrow Z,$$

then there exists a uniquely defined (up to a contractible space of choices) morphism

$$\mathcal{D}_{X/Y}^{\mathrm{an}} \rightarrow Z,$$

in the  $\infty$ -category  $\mathrm{AnFMP}_{X//Y}$ . Moreover, we are reduced to check this property locally on  $Y$ , in which case the assertion follows immediately from the construction.  $\square$

**3.5. The Hodge filtration.** Let  $f: X \rightarrow Y$  be a closed immersion in  $\mathrm{dAnSt}_k$ . In this §, we will describe the construction of the Hodge filtration on the deformation to the normal bundle  $\mathcal{D}_{X/Y}^{\mathrm{an}}$  associated to  $f$ . We first deal with the  $k$ -affinoid case:

*Construction 3.27.* Let  $f: X \rightarrow Y$  be a closed immersion in the  $\infty$ -category  $\mathrm{dAfd}_k$ . Consider the induced morphism

$$f^{\mathrm{alg}}: X^{\mathrm{alg}} \rightarrow Y^{\mathrm{alg}},$$

where  $X^{\mathrm{alg}} = \mathrm{Spec} A$  and  $Y^{\mathrm{alg}} = \mathrm{Spec} B$ , with

$$A := \Gamma(X, \mathcal{O}_X^{\mathrm{alg}}) \quad \text{and} \quad B := \Gamma(Y, \mathcal{O}_Y^{\mathrm{alg}}).$$

The morphism  $f^{\mathrm{alg}}$  is a closed immersion of affine derived schemes. Consider also the closed immersion

$$g := f^{\mathrm{alg}} \times \mathrm{id}_{\mathbb{A}_k^1}: X \times \mathbb{A}_k^1 \rightarrow Y \times \mathbb{A}_k^1,$$

in  $\mathrm{dAff}_k$ . By Noetherian approximation, we can write  $g$  as an inverse limit of the form

$$\lim_{\alpha \in I^{\mathrm{op}}} g_\alpha: \lim_{\alpha \in I^{\mathrm{op}}} X_\alpha \times \mathbb{A}_k^1 \rightarrow \lim_{\alpha \in I^{\mathrm{op}}} Y_\alpha \times \mathbb{A}_k^1,$$

where  $I$  is a filtered  $\infty$ -category and for each index  $\alpha \in I$ , we have that

$$g_\alpha: X_\alpha \times \mathbb{A}_k^1 \rightarrow Y_\alpha \times \mathbb{A}_k^1,$$

is a closed immersion in the  $\infty$ -category  $\mathrm{dAff}_k^{\mathrm{laft}}$ . Fix some  $\alpha \in I$ . Thanks to Proposition 3.4, there exists a sequence of square-zero extensions of the form

$$X_\alpha \times \mathbb{A}_k^1 = X_\alpha^{(0)} \hookrightarrow X_\alpha^{(1)} \hookrightarrow \dots \hookrightarrow X_\alpha^{(n)} \hookrightarrow \dots \rightarrow Y_\alpha \times \mathbb{A}_k^1,$$

such that each term comes equipped with a natural action of the quotient stack

$$[\mathbb{A}_k^1/\mathbb{G}_m] \in \mathrm{dSt}_k.$$

**Lemma 3.28.** *Let  $n \geq 0$ , and let  $\alpha \rightarrow \beta$  be a morphism in  $I^{\mathrm{op}}$ . Then the transition morphism*

$$X_\alpha \times \mathbb{A}_k^1 \rightarrow X_\beta \times \mathbb{A}_k^1,$$

*lifts to a well defined induced morphism*

$$X_\alpha^{(n)} \rightarrow X_\beta^{(n)},$$

*in  $\mathrm{dAff}_k^{\mathrm{laft}}$ .*

*Proof.* The result follows immediately from the naturality of the construction in [11, §9.5.1].  $\square$

We now introduce the (algebraic) Hodge filtration associated with the closed immersion  $f^{\mathrm{alg}}: X^{\mathrm{alg}} \rightarrow Y^{\mathrm{alg}}$ :

**Definition 3.29.** Consider the morphism  $g: X^{\mathrm{alg}} \times \mathbb{A}_k^1 \rightarrow Y^{\mathrm{alg}} \times \mathbb{A}_k^1$  above. Lemma 3.28 implies that for each  $n \geq 0$ , we have a well defined object

$$X^{\mathrm{alg},(n)} := \lim_{\alpha \in I^{\mathrm{op}}} X_\alpha^{(n)} \in \mathrm{dAff}_k,$$

which fits into a sequence of square-zero extensions

$$X \times \mathbb{A}_k^1 = X^{\mathrm{alg},(0)} \hookrightarrow X^{\mathrm{alg},(1)} \hookrightarrow \dots \hookrightarrow X^{\mathrm{alg},(n)} \hookrightarrow \dots \rightarrow Y^{\mathrm{alg}},$$

in  $\mathrm{dAff}_k$ . We shall refer to the sequence of the  $X^{\mathrm{alg},(n)}$  as the *algebraic Hodge filtration* associated to the morphism  $f^{\mathrm{alg}}$ . Moreover, thanks to Proposition 3.4 (4) it follows that we have a natural morphism

$$\mathrm{colim}_{n \geq 0} X^{\mathrm{alg},(n)} \rightarrow \lim_{\alpha \in I^{\mathrm{op}}} \mathcal{D}_{X_\alpha/Y_\alpha}, \quad (3.4)$$

in the  $\infty$ -category  $\mathrm{FMP}_{X \times \mathbb{A}_k^1/Y \times \mathbb{A}_k^1}$ .

The following result implies that the Hodge filtration associated to  $f^{\mathrm{alg}}$  does not depend on choices:

**Corollary 3.30.** *The derived stack*

$$\lim_{\alpha} \mathrm{colim}_{n \geq 0} X_\alpha^{(n)} \simeq \lim_{\alpha} \mathcal{D}_{X_\alpha/Y_\alpha},$$

*is an affine scheme. Moreover, the natural morphism*

$$\gamma: \mathrm{colim}_{n \geq 0} X^{\mathrm{alg},(n)} \rightarrow \lim_{\alpha \in I^{\mathrm{op}}} \mathrm{colim}_{n \geq 0} X_\alpha^{(n)},$$

*is an equivalence of derived affine schemes.*

*Proof.* The first assertion follows immediately from Lemma 3.28 combined with Proposition 3.4 (4) and the fact that for each  $n \geq 0$ ,  $X_\alpha^{(n+1)}$  is a square-zero extension on  $X_\alpha^{(n)}$  via an object

$$\mathcal{F}^{(n+1)} \in \mathrm{Coh}^{\geq n}(X_\alpha^{(n)}). \quad (3.5)$$

We further deduce that

$$\mathrm{colim}_{n \geq 0} X^{\mathrm{alg},(n)} \in \mathrm{dAff}_k.$$

Indeed, it follows immediately from the construction that  $X^{(n+1),\mathrm{alg}}$  is a square-zero extension of  $X^{\mathrm{alg},(n)}$  by some

$$\mathcal{G}^{(n+1)} \in \mathrm{Coh}^{\geq n}(X^{\mathrm{alg},(n)}). \quad (3.6)$$

We conclude thus that the filtered colimit  $\mathrm{colim}_{n \geq 0} X^{\mathrm{alg},(n)}$  is an affine derived  $k$ -scheme, as well. In a similar vein, we also deduce that the inverse limit

$$\lim_{\alpha \in I^{\mathrm{op}}} \mathcal{D}_{X_\alpha/Y_\alpha} \in \mathrm{dAff}_k.$$

Let  $A, B \in \mathrm{CAlg}_k$  denote the derived rings of derived global sections of both

$$\mathrm{colim}_{n \geq 0} X^{\mathrm{alg},(n)} \quad \text{and} \quad \lim_{\alpha \in I^{\mathrm{op}}} \mathcal{D}_{X_\alpha/Y_\alpha}.$$

Similarly, denote by  $A^{(n)} := \Gamma(X^{\mathrm{alg},(n)}, \mathcal{O}_{X^{\mathrm{alg},(n)}})$  and, for each  $\alpha \in I$ , let  $B_\alpha^{(n)} := \Gamma(X_\alpha^{(n)}, \mathcal{O}_{X_\alpha^{(n)}})$ . Thanks to (3.5) and (3.6) we deduce that, for each  $i \geq 0$ , one has equivalences

$$\pi_i(A) \simeq \pi_i(A_\alpha^{(n)}) \quad \text{and} \quad \pi_i(B) \simeq \mathrm{colim}_{\alpha \in I} \pi_i(B_\alpha^{(n)}),$$

for all  $n \geq i$  sufficiently large. In particular, by the construction of  $X^{\mathrm{alg},(n)}$  we deduce that

$$\pi_i(A^{(n)}) \simeq \mathrm{colim}_{\alpha \in I} \pi_i(B_\alpha^{(n)}),$$

which concludes the proof.  $\square$

**Definition 3.31.** Let  $f: X \rightarrow Y$  be a closed immersion in the  $\infty$ -category  $\mathrm{dAff}_k$ . We shall define the *algebraic deformation to the normal bundle associated to  $f^{\mathrm{alg}}$*  as the colimit

$$\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}} := \mathrm{colim}_{n \geq 0} X^{\mathrm{alg},(n)},$$

computed in the  $\infty$ -category  $\mathrm{FMP}_{X/Y}$ .

We will need the following auxiliary result:

**Lemma 3.32.** *The object*

$$\lim_{\alpha \in I^{\mathrm{op}}} \mathcal{D}_{X_\alpha/Y_\alpha} \in (\mathrm{dSt}_k)_{X^{\mathrm{alg}} \times \mathbb{A}_k^1 // Y^{\mathrm{alg}} \times \mathbb{A}_k^1},$$

*belongs to the full subcategory  $\mathrm{FMP}_{X^{\mathrm{alg}} \times \mathbb{A}_k^1 // Y^{\mathrm{alg}} \times \mathbb{A}_k^1}$ . In particular, the natural morphism*

$$\mathcal{D}_{X^{\mathrm{alg}}/Y^{\mathrm{alg}}} \rightarrow \lim_{\alpha \in I^{\mathrm{op}}} \mathcal{D}_{X_\alpha/Y_\alpha},$$

*is an equivalence in  $\mathrm{FMP}_{X^{\mathrm{alg}} \times \mathbb{A}_k^1 // Y^{\mathrm{alg}} \times \mathbb{A}_k^1}$ .*

*Proof.* For each  $\alpha \in I$  let us denote by

$$h_\alpha: X \rightarrow X_\alpha,$$

the structural morphism. Thanks to [19, Corollary 4.4.1.3] combined with [19, Corollary 4.5.1.3] we conclude that the natural morphisms

$$\theta_\alpha: h_\alpha^* \mathbb{L}_{X_\alpha} \rightarrow \mathbb{L}_X, \quad \text{for each } \alpha \in I,$$

assemble to provide an equivalence

$$\theta: \operatorname{colim}_{\alpha \in I} h_{\alpha}^* \mathbb{L}_{X_{\alpha}} \rightarrow \mathbb{L}_X,$$

in the  $\infty$ -category  $\operatorname{QCoh}(X^{\text{alg}})$ . As a consequence, given any pushout diagram

$$\begin{array}{ccc} S & \xrightarrow{g_S} & S' \\ \downarrow & & \downarrow \\ T & \longrightarrow & T', \end{array}$$

in the  $\infty$ -category  $\operatorname{Nil}_{X/}$ , where  $g_S$  is a square-zero extension, we can write it as an inverse limit of pushout diagrams of the form

$$\begin{array}{ccc} S_{\alpha} & \xrightarrow{g_{S_{\alpha}}} & S'_{\alpha} \\ \downarrow & & \downarrow \\ T_{\alpha} & \longrightarrow & T'_{\alpha}, \end{array}$$

in  $\operatorname{Nil}_{X_{\alpha}/}$ , for large enough  $\alpha \in I$ . It then follows that we have a chain of natural equivalences of the form

$$\begin{aligned} \lim_{\alpha \in I^{\text{op}}} \mathcal{D}_{X_{\alpha}/Y_{\alpha}}(T') &\simeq \left( \lim_{\alpha \in I^{\text{op}}} \mathcal{D}_{X_{\alpha}/Y_{\alpha}} \right) \left( \lim_{\alpha \in A^{\text{op}}} T'_{\alpha} \right) \\ &\simeq \lim_{\alpha \in I^{\text{op}}} (\mathcal{D}_{X_{\alpha}/Y_{\alpha}}(T'_{\alpha})) \\ &\simeq \lim_{\alpha \in I^{\text{op}}} \mathcal{D}_{X_{\alpha}/Y_{\alpha}}(S'_{\alpha} \times_{S_{\alpha}} T_{\alpha}) \\ &\simeq \lim_{\alpha \in I^{\text{op}}} \mathcal{D}_{X_{\alpha}/Y_{\alpha}}(S'_{\alpha}) \times \lim_{\alpha \in A^{\text{op}}} \mathcal{D}_{X_{\alpha}/Y_{\alpha}}(S_{\alpha}) \lim_{\alpha \in A^{\text{op}}} \mathcal{D}_{X_{\alpha}/Y_{\alpha}}(T_{\alpha}), \end{aligned}$$

and we deduce that  $\lim_{\alpha \in I^{\text{op}}} \mathcal{D}_{X_{\alpha}/Y_{\alpha}} \in \operatorname{FMP}_{X//Y}$ , as desired. Corollary 3.30 implies that the canonical morphism

$$\theta: \mathcal{D}_{X^{\text{alg}}/Y^{\text{alg}}} \rightarrow \lim_{\alpha \in I^{\text{op}}} \mathcal{D}_{X_{\alpha}/Y_{\alpha}},$$

is an equivalence in  $\operatorname{dSt}_k$ . The second part of the Lemma follows from the first part since it implies that  $\theta$  lies in the full subcategory  $\infty$ -category  $\operatorname{FMP}_{X//Y}$ .  $\square$

We now introduce the *non-archimedean Hodge filtration*:

**Definition 3.33.** Let  $f: X \rightarrow Y$  be a closed immersion in the  $\infty$ -category  $\operatorname{dAfd}_k$ . For each  $n \geq 0$ , we define the square-zero extension

$$X \times \mathbf{A}_k^1 \hookrightarrow X^{(n)},$$

as the relative analytification,  $(-)^{\text{an}}$ , of the square-zero extension

$$X^{\text{alg}} \times \mathbf{A}_k^1 \hookrightarrow X^{\text{alg},(n)},$$

introduced in Definition 3.29. By construction, for each  $n \geq 0$ , we have structural morphisms

$$X^{(n)} \rightarrow Y \times \mathbf{A}_k^1.$$

We shall refer to the sequence

$$X \times \mathbf{A}_k^1 := X^{(0)} \hookrightarrow X^{(1)} \hookrightarrow \dots \hookrightarrow X^{(n)} \hookrightarrow \dots \rightarrow Y \times \mathbf{A}_k^1,$$

as the *non-archimedean Hodge filtration associated to the morphism  $f$* .

Putting together the above results we can easily deduce:

**Corollary 3.34.** *There exists a natural morphism*

$$\operatorname{colim}_{n \geq 0} X^{(n)} \rightarrow \mathcal{D}_{X/Y}^{\text{an}},$$

which is furthermore an equivalence in the  $\infty$ -category  $\operatorname{AnFMP}_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1}$ .

*Proof.* Since the natural functor

$$\operatorname{AnFMP}_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1} \rightarrow \operatorname{dAnSt}_k)_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1},$$

commutes with filtered colimits, we are reduced to prove the statement of the Corollary in the  $\infty$ -category  $(\operatorname{dAnSt}_k)_{X \times \mathbf{A}_k^1 // Y \times \mathbf{A}_k^1}$ . The result is now an immediate consequence of Lemma 3.32 combined with Proposition 3.22 and the fact that relative analytification commutes with filtered colimits (as it is defined as left Kan extension).  $\square$

We now globalize the Hodge filtration to geometric derived  $k$ -analytic stacks:

*Construction 3.35.* Let  $f: X \rightarrow Y$  be a closed immersion, admitting a deformation theory, of derived  $k$ -analytic stacks, where we further assume that  $X$  is a geometric derived  $k$ -analytic stack. Suppose we are given a morphism

$$U \rightarrow Y,$$

in  $\operatorname{dAnSt}_k$ , where  $U \in \operatorname{dAfd}_k$ . Form the pullback diagram

$$\begin{array}{ccc} X_U & \longrightarrow & U \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

in  $\operatorname{dAnSt}_k$ . Suppose we are now given a morphism of derived  $k$ -affinoid spaces  $V \rightarrow U$ . Consider the pullback diagram

$$\begin{array}{ccc} X_V & \longrightarrow & X_U \\ \downarrow & & \downarrow \\ V & \longrightarrow & U, \end{array}$$

in the  $\infty$ -category  $\operatorname{dAfd}_k$ . By naturality of the Hodge filtration we deduce that, for each  $n \geq 0$ , we have natural commutative diagrams

$$\begin{array}{ccc} X_V^{(n)} & \longrightarrow & X_U^{(n)} \\ \downarrow & & \downarrow \\ V & \longrightarrow & U, \end{array} \tag{3.7}$$

of the  $n$ -th pieces of the Hodge filtrations on  $\mathcal{D}_{X_U/U}$  and  $\mathcal{D}_{X_V/V}$ , respectively.

**Lemma 3.36.** *The commutative square in (3.7) is a pullback square in the  $\infty$ -category  $\operatorname{dAfd}_k$ .*

*Proof.* Thanks to Lemma 3.16 it suffices to prove that for each  $n \geq 0$ , the induced diagram

$$\begin{array}{ccc} X_V^{\text{alg},(n)} & \longrightarrow & X_U^{\text{alg},(n)} \\ \downarrow & & \downarrow \\ V^{\text{alg}} & \longrightarrow & U^{\text{alg}} \end{array},$$

is a pullback square in  $\mathrm{dAff}_k$ . By a standard argument of Noetherian approximation, we might assume that  $U' := U^{\mathrm{alg}}$  and  $V' := V^{\mathrm{alg}}$  are both affine derived affined  $k$ -schemes almost of finite presentation. We observe that for each  $n \geq 0$ , the morphisms

$$g_n: X_{V'}^{(n)} \rightarrow X_{U'}^{(n)},$$

are  $[\mathbf{A}_k^1/\mathbb{G}_m]$ -equivariant. For this reason, they induce morphisms

$$g_{n,*}^{\mathrm{IndCoh}}(\mathbb{T}_{X_{V'}^{(n)}/V'}) \rightarrow \mathbb{T}_{X_{U'}^{(n)}/U'},$$

in the  $\infty$ -category  $\mathrm{IndCoh}(X_{V'}^{(n)})$  respecting the natural filtrations. In particular, we have an induced morphism at the  $n$ -th piece of the filtration

$$g_{n,*}^{\mathrm{IndCoh}}(\mathrm{Sym}^{n+1}(\mathbb{T}_{X_{U'}^{(n)}/U'}[-1])[1]) \rightarrow \mathrm{Sym}^{n+1}(\mathbb{T}_{X_{V'}^{(n)}/V'}[-1])[1],$$

(c.f. [11, Theorem 9.5.1.3]). The result is now a direct consequence of Proposition 3.4 (3) combined with [20, Proposition 5.12] and [19, Proposition 2.5.4.5].  $\square$

*Construction 3.37.* Consider the relative analytification functor

$$\begin{aligned} (-)^{\mathrm{an}}_Y: \lim_{U \in Y_{\mathrm{\acute{e}t}}^{\mathrm{afd}}} (\mathrm{dSt}_k)_{/U^{\mathrm{alg}} \times \mathbf{A}_k^1} &\rightarrow \lim_{U \in Y_{\mathrm{\acute{e}t}}^{\mathrm{afd}}} (\mathrm{dAnSt}_k)_{/U \times \mathbf{A}_k^1} \\ &\simeq (\mathrm{dAnSt}_k)_{/Y \times \mathbf{A}_k^1}. \end{aligned}$$

Thanks to Lemma 3.36, for each  $n \geq 0$  the object

$$\{X_U^{\mathrm{alg},(n)}\}_{U \in Y_{\mathrm{\acute{e}t}}^{\mathrm{afd}}} \in \lim_{n \geq 0} (\mathrm{dSt}_k)_{/U^{\mathrm{alg}}}.$$

Therefore, after taking its relative analytification we produce well defined objects  $X^{(n)} \in (\mathrm{dAnSt}_k)_{Y \times \mathbf{A}_k^1}$ . Moreover, it follows essentially by construction that the latter restrict to the usual Hodge filtration for each étale morphism in  $\mathrm{dAnSt}_k$

$$g: U \rightarrow Y,$$

in  $Y_{\mathrm{\acute{e}t}}^{\mathrm{afd}}$ . Moreover, by construction we have a natural morphism

$$\mathrm{colim}_{n \geq 0} X^{(n)} \rightarrow \mathcal{D}_{X/Y}^{\mathrm{an}},$$

which is an equivalence in the  $\infty$ -category  $\mathrm{dAnSt}_k$ .

We can thus summarize the previous results in the form of a main theorem:

**Theorem 3.38.** *Let  $f: X \rightarrow Y$  be a closed immersion of derived  $k$ -analytic stacks admitting a deformation theory and  $X$  is geometric. Then the following assertions hold:*

- (1) *There exists a deformation to the normal bundle  $\mathcal{D}_{X/Y}^{\mathrm{an}} \in (\mathrm{dAnSt}_k)_{\mathbf{A}_k^1}$  such that its fiber at  $\{0\} \subseteq \mathbf{A}_k^1$  coincides with the shifted  $k$ -analytic tangent bundle*

$$\mathbb{T}_{X/Y}^{\mathrm{an}}[1]^\wedge,$$

*completed at the zero section  $s_0: X \rightarrow \mathbb{T}_{X/Y}^{\mathrm{an}}[1]$ . Moreover, its fiber at  $\lambda \neq 0$  coincides with the formal completion  $Y_X^\wedge$  of  $Y$  at  $X$  along  $f$ ;*

- (2) *The object  $\mathcal{D}_{X/Y}^{\mathrm{an}}$  admits a left-lax equivariant action of the (multiplicative) monoid-object  $\mathbf{A}_k^1$  in  $\mathrm{dAnSt}_k$ ;*

(3) There exists a sequence of left-lax  $\mathbf{A}_k^1$ -equivariant square-zero extensions

$$X \times \mathbf{A}_k^1 = X^{(0)} \hookrightarrow X^{(1)} \hookrightarrow \dots \hookrightarrow X^{(n)} \hookrightarrow \dots \rightarrow Y \times \mathbf{A}_k^1.$$

Moreover, for each  $n \geq 0$ , the relative  $k$ -analytic cotangent complex

$$\mathbb{L}_{X^{(n)}/Y} \in \mathrm{Coh}^+(X^{(n)}),$$

is equipped with a (decreasing) filtration such that its  $n$ -th piece identifies canonically with  $\mathrm{Sym}^{n+1}(\mathbb{L}_{X/Y}[-1])[1]$ .

In particular, the square-zero extension  $X^{(n)} \rightarrow X^{(n+1)}$  is obtained via the canonical composite

$$\mathbb{L}_{X^{(n)}} \rightarrow \mathbb{L}_{X^{(n)}/Y} \rightarrow \mathrm{Sym}^{n+1}(\mathbb{L}_{X/Y}^{\mathrm{an}}[-1])[1],$$

in  $\mathrm{Coh}^+(X^{(n)})$ ;

(4) We have a natural morphism

$$\mathrm{colim}_{n \geq 0} X^{(n)} \rightarrow \mathcal{D}_{X/Y}^{\mathrm{an}},$$

which is furthermore an equivalence in the  $\infty$ -category  $\mathrm{dAnSt}_k$ ;

(5) Assume that  $f: X \rightarrow Y$  is a closed immersion of derived  $k$ -affinoid spaces with  $A := \Gamma(X, \mathcal{O}_X^{\mathrm{alg}})$  and  $B := \Gamma(Y, \mathcal{O}_Y^{\mathrm{alg}})$ . Then the corresponding filtration on (derived) global sections of the formal completion  $Y_X^\wedge$  (via points (1) and (3)) identifies canonically with the  $I$ -adic filtration on  $B$ , where  $I := \mathrm{fib}(B \rightarrow A)$ .

*Proof.* Claim (1) follows immediately from Lemma 3.23. Assertion (2) follows immediately from Proposition 3.22, as in the algebraic case, the deformation  $\mathcal{D}_{X^{\mathrm{alg}}/Y}$  admits a natural left-lax  $\mathbf{A}_k^1$ -equivariant action. The statement in point (4) is essentially the content of Corollary 3.34 and point (3) follows from the construction of the Hodge filtration in the non-archimedean setting combined with Noetherian approximation (for the relative cotangent complex) and Proposition 3.4 (3). Finally, claim (4) follows readily from Lemma 3.9 and the fact that both the Hodge filtration and the  $I$ -adic filtrations are compatible via relative analytification.  $\square$
